technology has been in progress for sometime now alongside a ramp-up in rollouts with e-mobility.

AUTOMATION REVOLUTION

The AI model deployed to a self-reliant vehicle makes it future-ready and prone to precision. A normal vehicle can be converted into an autonomous car by integrating some key components into its system. These include sensors that allow the car to take informed decisions by tracking the surrounding ambience and aligning with it as well as regulating its own movement. Independent cars are well-programmed to treat volumes of humongous data traffic from various sensors like video cameras, LiDAR (Light Detection and Ranging), RADAR (Radio Detection And Ranging), GPS (Global Positioning System) or inertia sensors. By applying deep learning algorithms, driverless technology rests on vital decisions pertinent to the environment the carriage passes through.

Many blue-chip companies are fast catching up with the wave of self-driving technology and are heavily investing in it to make it reliable on the roads. Of late, notable entities like Google, Uber, Tesla, et al parked money on the driverless edition of sedans and built their own ilk of autonomous automobiles. Significantly, Uber recently inked a driverless deal with Motional (a joint venture between automaker Hyundai Motor Group and auto supplier Aptiv founded in March 2020) to push the envelope for autonomous driving, which many would love to believe, will

Imagine this pulling up in your neighbourhood

eventually lead to a fresh atmosphere by subsiding the smog intensity.

A bevy of automakers, namely Motional, Refraction AI, Optimus Ride, Waymo, Zoox, nuTonomy, AutoX and Drive.ai are the front runners in fashioning AI vehicles with their class of autonomous technology being leveraged either for public commute, ride-sharing or for private use.

Hyundai had launched the Kona EV in India back in 2019 with a starting price of ₹20 lakhs. Although the cost is in the high-end range, yet the response has been awesome so far, confirms Ravi Sharma, spokesperson, corporate communications at HMIL. "We have plans to unveil the next-generation robotaxi Hyundai IONIQ 5 in India next year (2023)," he announces. Incidentally, the model was launched globally from the Motional stable in 2021. Besides this auto giant with an eye-catching fleet, there are manufacturers like Tata and Mahindra dealing in electric cars and shaping up some newfangled models.

IS INDIA READY FOR DRIVERLESS INNOVATION?

As it stands, autonomous driving is subject to in-depth research and

endless experimentations before it finally sees the light of the day. Against the backdrop of heavy traffic snarls, jaywalking tendencies by commuters, encroachment by hawkers on roads, kiosks and shanties occupying a considerable part of the streets, flouting of traffic rules, frequency of accidents — will self-driving technology remain a dream for India?

Driver Ramesh Sahu from Odisha fathoms the difficulty of launching such a means of transport on Indian roads. "This looks absolutely impossible. People behind the steering wheels always tend to overtake other vehicles, straying into their path more often than not, thus violating traffic norms. This is as if they are in a race. Also, road rage complaints are frequently lodged to bring the public transport drivers to book who have the propensity to rash drive," reasons the motorist of a popular app cab aggregator.

The traffic department rather observes a wait-and-watch policy on this front. An officer at Kolkata Traffic Police (control room), throws the ball in the ruling government's court. "It is up to the powers that be to decide on the introduction of autonomous traffic. All depends on thorough testing and several stages of experimentation. The velocity rate of the car is also scrutinized before lending a nod to such ground-breaking projects," he clarifies.

Earlier in March this year, Nitin Gadkari, Union Minister of Road Transport and Highways, looked distraught over the alarming annual rate of accidents happening on Indian roads and the proportion of fatality caused

ASUS
IN SEARCH OF INCREDIBLE

ASUS Mini PC PN63-S1

Easy Modification, Maximum Possibilities

- » Upgrade-friendly
- » Stunning 4K UHD resolution and dual display support
- » Improved Cooling
- » Triple storage design
