Dawn of a new era of GPUs?

How AMD RDNA 3 is an all-new approach towards high-performance gaming GPUs

Soham Raninga | soham@digit.in

E

arlier this month, AMD launched its latest (and greatest) line of top-end Radeon RX 7900

XTX and XT GPUs based on the brand-new AMD RDNA 3 architecture. The AMD RDNA 3 is a new approach towards high-performance GPUs, it's got quite a few firsts in the segment and is also a very measured and tactical move by AMD to take on the high-performance GPU market where NVIDIA has some big guns with the GeForce RTX 4090 that sits right at the top at the moment.

While we are yet to receive the review samples from AMD (and we can't wait to put the cards through a battery of strenuous tests), this article is focused on delving a bit

AMD CEO Dr. Lisa Siu with Soham

deeper into the RDNA 3 architecture and the calls that AMD took to maximize gaming performance.

AMD TAKES THE LEAD WITH THE WORLD'S FIRST CHIPLET DESIGN FOR A GAMING GPU

The chiplet approach is not entirely new for AMD, however, it is a first when it comes to GPU design. And the challenge of achieving the sweet spot where the decision to take the chiplet route is justified in every aspect was the key here for AMD. GPU architecture is a lot more complex (vs CPUs), given the need for much higher memory bandwidth and sensitivity to latency, AMD engineers and chip designers had to work a lot harder to make everything come together and perform at optimal levels.

Unlike conventional heterogeneous chip designs, with the Chiplet approach, AMD has split the GPU into two parts, the GCD (Graphics Compute Die) and the MCD (Memory Compute Die). The GCD is based on a 5nm process node while the MCD uses a 6nm process node.

WHY AMD TOOK THE CHIPLET CALL AND WHY IT SEEMS LIKE A SMART CHOICE

As per AMD, the shrinking nodes are increasingly delivering lesser gains while the yields are also decreasing. Which means you need to spend a lot more for that additional performance jump. Which directly impacts and elevates the cost of production. With the chiplet approach, AMD claims to have arrived at a smarter and optimal
