

Mini Pupper 2

Funding: \$113,399 of \$12,836 goal

Link: <https://dgit.in/minipup>

The era of robot pets has only just begun and it seems like there are plenty of little corporate companions waging a war for your affection.

Mini Pupper, however, is one such robot pet companion which is not developed by huge corporate entities and is in fact, open source!

Started by the company MangDang, the Mini Pupper Project has come up with big upgrades to the Mini Pupper 2 mainly focusing on upgrades on the servo motors used by the Pupper for movement, and major software upgradation revolving around position feedback making it much smarter than its predecessor.

Though the Mini Pupper 2 won't be able to show emotions just yet, if you're handy and smart enough, you can program it on your own to do whatever you want including training

it to write, follow objects around, and any other tasks that you can think of ***cough*** world domination ***cough***. The Mini Pupper 2 will also have a Pro variant which will have even more advanced features than the regular Mini Pupper 2 in terms of movement, path detection and more.

The funding options for the Mini Pupper 2 include a \$299 option for previous Mini Pupper 1 backers who have already received Mini Pupper 1 but will be receiving upgradation parts including the new servo motors and the newly designed custom circuit board, and \$500 for a complete Mini Pupper 2 set.

Azio Cascade 98

Funding: \$21,643 of \$10,000 goal

Link: <https://dgit.in/azio>

The Azio Cascade is a compact full-size hot-swappable mechanical keyboard which is one of the few keyboards to have a full-size number pad unlike other low-profile keyboards in a similar price range which is something a lot of people nitpick about. The Keyboard features a 100 percent layout with good keycaps and quality switches from Gateron while also featuring both wired, and wireless modes. There will be two variants of the Azio Cascade 98, namely the Standard variant, and the Low-Profile variant.

The standard variant will feature a durable aluminum body, a 4000mAh battery, full-size ABS keycaps, and G Pro Gateron Switches of your choice from Blue(clicky/loud), Brown(tactile/quiet), and Red(Linear/quiet) while being a part of the 100% layout of the keyboard.

Meanwhile, the Low profile variant will feature an overall thinner aluminum body of 29 mm height in total at the highest point, a 3000mAh battery, low-profile ABS keycaps accompanied by Gateron Low-Profile switches in the same three variants as before.

Both these variants will come with the capability to connect with up to 5 devices and be able to switch between those devices.

You can back the project with \$99 to receive an early bird offer and receive either the Slim or the Regular version of your choice or pay \$119 later to have the same offer.

LIVALL PikaBoost

Funding: \$1,105,750 of \$25,673 goal

Link: <https://dgit.in/pikaboost>

There have been multiple e-bike conversion kits that have come and gone and yet, none of them come close to the Pika-Boost. The thing that impresses us the most about this product is the seamless installation process and the sheer amount of compatibility that it offers to every single bike out there.

The PikaBoost is a single-handed product that you can carry around with you and use on whichever type of bike

you wish to use it on. The tool-less installation process makes it easy to convert any bike into an e-bike and makes it ready for you to be on your way either using pedal assist or be cruising around as you like.

Compared to other e-bike conversion kits, the PikaBoost is also a lighter

alternative weighing a mere 3 kilograms while also providing a similar amount of performance giving you up to 30 kilometers cruise on only battery.

This product by LIVALL not only converts your bike into an e-bike but also gives you other quality of life upgrades such as the ability to charge your phone on the go using the battery pack, the ability to recharge your pack using the kinetic energy produced when you pedal which greatly reduces the amount of times you'd have to charge your pack, and of course, simply using your bicycle as a moped when you are tired.

You can pledge \$309 to the PikaBoost on Kickstarter to receive a unit for yourself as part of the early bird offer, which is the most economical option as of now.
