ChatGPT

Examples	Capabilities	Limitations
"Explain quantum computing in simple terms" →	Remembers what user said earlier in the conversation	May occasionally generate incorrect information
"Got any creative ideas for a 10 year old's birthday?" →	Allows user to provide follow-up corrections	May occasionally produce harmful instructions or biased content
"How do I make an HTTP request in Javascript?" →	Trained to decline inappropriate requests	Limited knowledge of world and events after 2021

Write a paragraph about why AI cannot replace human writers

Once upon a time, Draco Malfoy and Hermione Granger were standing on the Hogwarts castle balcony, staring out at the moonlit sky. Draco turned to Hermione and said, "You know, for someone who's supposed to be so smart, you can be really dense sometimes."

Hermione rolled her eyes and replied, "And you're supposed to be a Malfoy, but you're not half as clever as you think you are."

Despite their constant bickering, there was a spark of attraction between them that they couldn't deny. Draco took a step closer to Hermione and brushed a strand of hair out of her face. "You know, I've always had a bit of a thing for you," he said quietly.

Hermione's eyes widened in surprise. "Really? Because I've always thought you were a bit of a prat," she said, trying to hide the fact that her heart was racing.

Draco chuckled and leaned in closer. "I can be a prat," he admitted. "But I also know how to treat a lady."

Before Hermione could respond, Draco leaned in and pressed his lips to hers. It was a slow, gentle kiss that left them both breathless. When they finally pulled away, they were both smiling.

Try again

GPT-3 hype is too much. AI is going to change the world, but GPT-3 is just an early glimpse."

Now, that's scary.

HOW WILL CHATGPT, AND OTHER AI-BASED TOOLS, DISRUPT, WELL, THE WORLD?

Naturally, the virality of ChatGPT inspired a host of questions about whether the software could eventually replace humans. After all, even with an app that's described as an "early glimpse" of what AI can

actually do once developed properly, we're already able to envision pawning off entry-level jobs and tasks to such bots. This is particularly true for specific language-based fields such as coding, and writing, however, we may see applications of AI in other creative fields such as art and music as well.

Recently, OpenAI's AI-based art generator, Dall-e, also received quite a bit of attention on social media for being able to create any form of visual art based on the text you

input. As long as you can imagine it, the software will generate it for you, for the low-low price of \$0.02 (which is around ₹1.65) for an image with 1024x1024 pixel resolution, and \$0.018 (which is around ₹0.15) for an image with 512x512 pixel resolution once you finish your free credits. This is basically peanuts for the content you are getting in return.

Considering that advertising and digital marketing agencies charge an arm and a leg for a single creative, using software like Dall-e could offer brands a fantastic way to save money, while also benefiting from high-quality creatives made for their audiences.

This, again, does throw the notion of not needing entry-level working professionals to complete tasks in the spotlight. Of course, Dall-e does not offer brand images, yet. But, here's a super realistic image of headphones that could be mistaken for a social media creative.

In a similar vein, a user on Twitter revealed that he built a Notes-like app in SWIFT using ChatGPT, while others have used the chatbot to create music, write e-mails, answer homework questions, write typical website content about their company's culture, draw mindmaps on world domination, understand code by typing a query in Hinglish, and, well, the list can go on and on.

Famed entrepreneur Naval Ravikant spoke of AI's applications as those that will supplement human tasks, rather than replace humans altogether, when he appeared on the Joe Rogan Experience 3 years ago.

He explains that the AI we're seeing is what is known as narrow AI and is based on pattern recognition. "There's nothing approaching creative thinking," he said, dismissing the idea that AI will take over the world in our lifetime.

He further explains that humans are far from modelling general intelligence as we are still unsure of how the brain actually works. **d**
