

Best Performing Display Phone

Shooting for the stars

With smartphones now being used to consume multimedia content on the go, phones with large and vibrant displays are now more desired than ever before. In 2022, demand for phones that can enable unique multimedia experiences went up significantly, with more and more buyers looking for phones that can be used for watching movies, playing games, and even working from home. But, not all phones can promise big and beautiful displays. Luckily, we tested a few phones that can. So read on to know which are the best display phones in the country right now.

Winner: iPhone 14 Pro Max

The Apple iPhone 14 Pro Max is an easy recommendation for those looking for the fastest and one of the best phones in the market. However, what makes it truly special is its gorgeous display. It is a 6.7-inch Super Retina XDR OLED display with Dolby Vision support and a maximum rated brightness of 2,000 nits. This officially makes it the brightest display to ever grace a smartphone so far. In our tests indoors, the display went up to 901 nits of maximum brightness, and outdoors, it touched around 1550 nits. The display

is a treat to consume content with rich colours, deep blacks, and excellent viewing angles. It is topped with Apple's Ceramic Shield that is as tough and resistant to drops as ever. And in case you were wondering, this panel is also very power-efficient. The iPhone 14 Pro Max comes with an LTPO panel with an adaptive refresh rate from 1 Hz to 120 Hz, which in essence helps it save on energy and helps prolong runtime on a single charge

Runner-up: OnePlus 10 Pro

The panel on the OnePlus 10 Pro is great for daily use, be it for watching videos or browsing your social media feeds, you are never left asking for more. It is a second-generation LTPO panel that can automatically switch

between a refresh rate of 1Hz-120Hz based on the usage habits making it quite efficient for power saving. You can also select between QHD+ and FHD+ screen resolutions or let it select the resolution automatically based on the content being watched. The display is vibrant and can get bright enough offering great sunlight legibility. The phone also proved to be one of the better performers in our suite of Calman tests, where it clocked up really impressive numbers in the colour accuracy and gamut coverage tests.

Best Buy: Xiaomi 12 Pro

Xiaomi's flagship truly shines the moment you focus on the display. With its 6.73-inch LTPO AMOLED screen, capable of churning out 522 pixels per inch, the Xiaomi 12 Pro is great for watching movies and TV shows on it. Its good colour accuracy and viewing angles also make it a brilliant phone for playing games on it. We also get support for a high resolution of 3200 x 1440 pixels and up to 120Hz fast refresh rates. All this at a very aggressive price point, making the Xiaomi 12 Pro a worthy winner of the title of Best Buy for the Best Performing Display Phone of 2022 category.
