

SCIENCE IS THE PATH TO KNOWLEDGE, AND FINDING OUT ABOUT HOW OUR UNIVERSE WORKS. YOU CAN'T BE A GEEK AND NOT KNOW YOUR SCIENCE!

THIS MONTH IN SCIENCE:

We look back at the best astronomical pictures from 2022, and take a deep dive into NASA's latest finding about the most powerful gamma ray explosion ever recorded!

Gone before time

A recent study has found that mammoths may have been wiped off the face of planet Earth, much earlier than what the DNA evidence suggests at the moment.

A fiery hourglass in space

NASA's James Webb Telescope has been treating us with stunning visuals from space since its deployment in December 2021. In its latest treat, it has signalled back images of a fiery hourglass-like structure forming during the process of star formation. These new images, as per the experts at NASA, would provide new insights into the process of the formation of a new star.

The images in focus right now, have revealed the features of the protostar hidden inside the neck of the hourglass-shaped dark cloud L1527. This feat was achieved by the telescope using its Near Infrared Camera (NIRCam). What worked in favour of the telescope when it attempted to click the pictures was the fact that

the clouds in the "Taurus star-forming region" are only shown in infrared light.

The descrip-

tion of the image as given by the folks at the space agency would be like poetry to the ears of a science enthusiast – "The protostar itself is hidden from view within the 'neck' of this hourglass shape. An edge-on protoplanetary disc is seen as a dark line across the middle of the neck. Light from the protostar leaks above and below this disc, illuminating cavities within the surrounding gas and dust."

AIIMS suffers cyberattack

All India Institute of Medical Sciences, was under a cyberattack that left it experiencing power outages. These outages have proved to be quite disastrous, with hundreds of patients, as well as operations processes like billing, diagnostics, admissions, discharges, and so on, being affected by the same. A report on Tech Crunch satiated that the cyberattack came in the form of a ransomware attack, wherein many file

extensions were changed. In an attempt to get things back on track, AIIMS relied on manual operations. While these certainly helped to an extent, they did represent a slow-down in processes that would otherwise

take a few minutes, if not seconds. AIIMS soon reported the cyberattack to authorities. The National Informatics Centre and the Indian Computer Emergency Response Team are working together to resolve the issue as quickly as possible. An insider with direct access to information said that both teams are currently trying to restore data back-ups so that operations can become smoother.

Better for environment

Scientists have found out that the impact of dry pet food on the environment is much lower than that of wet food. The reason behind this is that in wet food, most of the proteins are animal based.

We vibin'?

As it has been found in a recent study conducted to explore the development of rat brains, they are capable of perceiving human music and giving a rhythmic response to the beats! So at the next Digit party, we'll have creepicheep dancing!

It's zombiefied

Sparking fears of another pandemic in the minds of people, scientists in Russia have revived a 48,500 years-old 'Zombie Virus'. The news of this new virus found its way to Twitter where it instantly hit the trending pages in all the regions.
