Microsoft partners up with ISRO to help space-tech startups in India

Microsoft and ISRO (Indian Space Research Organisation) signed an MoU (Memorandum of Understanding) on January 5th to empower space-tech startups in India. Microsoft will provide technical tools and mentoring support to space-tech startups across the country under this agreement. The space-tech startups marked by ISRO will be onboarded to Microsoft for Startups Founders Hub platform, which supports startup ideas at every stage from start to end. In the Microsoft for Startups Founders Hub platform, the founders will have free access to the technical tools of Microsoft like GitHub Enterprise, Visual Studio Enterprise, and Microsoft 365, and access to smart analytics with Power BI and Dynamics 365.

"ISRO's collaboration with Microsoft will greatly benefit space tech startups in their analysis and processing of vast amounts of satellite data for various applications, using cutting-edge methods like AI, Machine Learning and Deep Learning. The Microsoft for Startups Founders Hub is a useful platform for bringing together startups

and providers of technology solutions to support the national space technology ecosystem. We are pleased to work together to assist and support entrepreneurs, to in turn benefit the Indian economy as a whole" said the Chairman of ISRO, Shri S Somnath.

■ Search

Microsoft to reportedly launch Bing with an OpenAI feature

Microsoft plans to update its search engine Bing with ChatGPT of OpenAI, reportedly. This will result in more detailed information instead of just links to searches. Microsoft could be gearing up to really compete with Google with this update. The Bing update is likely to be rolled out by March. There is no further information on how Bing will operate with OpenAI's software. Microsoft had invested \$1 billion in OpenAI, and now this is the time when Microsoft will expect a return on its investment.

Microsoft is currently using tools from OpenAI like cloud services, that let users create text, code, and imagery using straightforward instructions and much more. The company introduced Copilot which uses OpenAI's tools to assist software engineers

automatically. Microsoft also uses OpenAI's technology in some consumer apps. Open AI launched GPT-3 in 2021 and Dall-E2 a year later, both are used by Microsoft to enterprise customers in its Azure server and compute-power renting business.

Microsoft hasn't revealed too many details about how it will avoid potential mistakes with objectionable content, which it had to deal with its Tay chatbot in 2016. What's

worth noting is that OpenAI wishes to charge a price in the future for ChatGPT to create text-generating bots. This means that Bing might be the only free access point to this trending GPT.

With Bing launching an OpenAI feature very soon, it appears Satya Nadella-led Microsoft will finally try to cause Google and its search dominance some serious harm, thanks to ChatGPT's current and future implementations. This will definitely help consumers, all of us netizens, at the end of the day – in our quest to search the length, breadth and depths of the WWW. Perhaps it will also tweak the change how we fundamentally search for information in the world.
