Motorola ThinkPhone: The coolest smartphone you just can't buy

Motorola unveiled a spiffy new smartphone known as the ThinkPhone, and while it's one of the coolest offerings the company has come out with, you probably won't be able to get your hands on it. The Motorola ThinkPhone is intended to be a B2B product (like the Blackberry once was before the explosion of BBM). The smartphone not only looks like the ThinkPad, but also comes with Mobile Device Management (MDM) software. It runs on Android 13, and promises updates for three years, along with security updates for four years. It runs on a Qualcomm Snapdragon 8+ Gen 1 processor with 8GB RAM and 256GB storage, and has a 6.6-inch AMOLED screen with a 120Hz refresh rate. The smartphone also comes with a 5,000 mAh with

68W fast charging. It also comes with a 50MP camera with OIS, along with a 13MP wide-angle, and a depth camera. It also has a 32MP selfie camera. The Motorola ThinkPhone will be released in January 2023 in Latin America, the USA, Europe, parts of Asia, and the Middle East. <https://dgit.in/MotoNo>

Lenovo unveils a laptop with a rotating E-Ink display

Lenovo's E-Ink offerings have taken people by storm. The new Lenovo ThinkBook Plus Twist comes with a 12-inch, front-lit colour E ink touch display and has a swivel at the bottom of the screen. This means that you can rotate the screen as you wish. What's super cool about

this is that when you swivel the screen to the right, the 2.8K OLED panel turns into the lid. It uses an e-ink touch display. Users can also shut the laptop to use it in tablet mode. Other features include an Intel Core i7 CPU and up to up to 16GB LPDDR5X RAM.

Samsung unveils its new OLED display that has 2,000 nits brightness

Samsung Display announced its new OLED display designed for smartphones during the CES 2023. This display has a peak brightness of 2,000 nits and thereby has a UDR 2000 certification. As Samsung uses the newest screens in its flagship offerings, we might end up seeing this display in the Samsung Galaxy

S23 Ultra. News about the UDR screen broke in June 2022, when Samsung applied for the trademark. The new OLED has been verified by Underwriter Laboratories and has the following verification ID V301789. For context, the Samsung Galaxy S22 has a peak brightness of 1750 nits. The display on the Apple iPhone 14, however, which was manufactured by Samsung, has a

peak brightness of 2,000 nits. To demonstrate how the display looks, Samsung compared its new UDR 2000 OLED display with a regular OLED screen and showed that the former had more brightness along with better dynamic range. Samsung also recently unveiled new monitors, the Samsung Odyssey

Neo G9 and the Samsung Odyssey OLED gaming monitors. The Samsung Odyssey Neo G9 is an ultra-wide monitor with an 8K resolution. This display comes with DisplayPort 2.1, is HDR-capable (and has a peak brightness of 1000 nits) and supports AMD's FreeSync Premium Pro-tech.
