

The PlayStation 5 shortage is officially over claims Sony

According to Sony, the shortage of PlayStation 5 is over. Jim Ryan announced during the CES presentation that “Everyone who wants a PS5 should have a much easier time finding one at retailers globally, starting from this point forward,” Sony also announced that the company has sold at least 30 million consoles, which represents an increase by 5 million since November.

The PlayStation 5 had hit markets in November 2020, and it took till August 2022 for customers to start finding it slightly easier to get their hands on the product. The shortage had made it hard for people to buy the console, and many had to wait for drops or be willing to pay high MRPs at chain stores. In fact, in America, the easiest way to purchase the PS5 was by purchasing the \$550 bundle, which included the PS5 with a disk drive along with a game. This, of course, is a markup when compared to the \$399.99 price tag for the digital console.

During the CES presentation, Ryan also thanked fans for being patient during the last two years, as they “managed unprecedented demand amid global challenges over the past two years.”

Google announces its new Android Auto Redesign

After months of waiting, Google has lifted the lid off its Android Auto redesign. The new UI looks more compact and has been created to ensure quick communication thanks to its features that are quite simple to use. The Android Auto dashboard is also believed to be more personal now, according to Google.

Google has already started rolling the new dashboard out to the users, and one does not have to join the Beta program in order to get this new update. The redesign makes it easier to play music, communicate, and navigate different functions. Users can also open up Google Maps straight from the dashboard.

There are also a couple of Material You-themed cards that can make it easier for you to find specific music or your favourite album. Google also has a quick launcher now that will help you find recently-used apps easily. It also supports split-screen layouts for

almost all apps. As a result, you can use Google Maps and Spotify at the same time.

The redesign has also brought updates to Google Assistant. It will now give you smart suggestions such as quick arrival time-sharing, missed call reminders, and instant access to podcasts and instant access. You can

also use on-screen shortcuts to reply to any message or call quickly. Competing directly with Apple's Car Play and other automakers' proprietary in-car infotainment software, it will be interesting to see how Google's latest iteration of Android Auto is received by not only fans of the software, but automobile users across the globe.
