

Project Leonardo is a PS5 accessibility controller introduced by Sony

Sony introduced a whole new type of controller at CES 2023 in Las Vegas called Project Leonardo. Project Leonardo is a first-party controller made for disabled people with the help of accessibility experts, game developers and the disabled community. Sony said that Project Leonardo controllers are customised in a way that will help disabled people play games more comfortably and for a long period. The controller is compatible with PS5 only.

Gaming for disabled people is not very easy and Sony introduced Project Leonard to break that barrier. Project Leonardo will help disabled people in many ways, giving them a valid way of playing new games, helping with motor control, and customising the placement of buttons and triggers. Users can customise the controller entirely

according to themselves. They can customise the shape and sizes of every stick and button. The design of Project Leonardo is split and it has been kept this way to help disabled people operate it easily because the standard controller was difficult to operate for some users. It has two 3.5mm AUX ports for different accessories.

In an interview with WIRED, the CEO and President of PlayStation Jim Ryan

said "Our aim for Project Leonardo is that it enables many more players to enjoy the remarkable games that PlayStation Studios and our development community are creating for PS5". The controller can be used as a stand-alone controller and can be paired with another Project Leonardo

controller and Dual Sense controller. The controller can even be paired with third-party buttons and switches.

Disabled people can now also be a part of the expanding gaming world now with the help of Project Leonard, which not just gives players access to playing every trendy game on the PS5 but also can be customised according to users to help them easily operate the controller.

New Qi2 wireless charging standard will bring MagSafe-like technology to Android phones

Recently, the Wireless Power Consortium announced the Qi2 standard, stating wireless chargers will leverage Apple's MagSafe technology to offer a new Magnetic Power Profile. The result of this may be more efficient wireless charging as well as the ability to charge other devices such as the batch of Android phones that will be launched in 2024.

The announcement by the Wireless Power Consortium comes close to the CES 2023 event, and it will speed up the need to replace the older Qi standard with this new one. Having said that, the devices that will be able to support Qi2 standards won't be launched until the end of the year. With Qi2, we may find more standardisation when it comes to

compatibility and speeds. At this point, the technology can support up to 15W charging. Apple offers wireless charging up to 7.5W, unless it is paired with an official MagSafe product (that have specific magnets). Explaining the technology, the Wireless Power Consortium said "Because it doesn't require

a flat surface-to-flat surface connection, the magnetic locking feature supports new product form factors, like an AR/VR headset. It will also support new types of accessories that magnetically attach to the back of the phone, like an extra battery."

At this point, there are no specific timelines regarding when smartphones will start using this technology.
