

Samsung ViewFinity S9 5K Monitor

Samsung has just announced its latest offering, the ViewFinity S9 monitor ahead of CES 2023. This is a 27-inch 5K display that the brand claims has been optimised for creative professionals such as video editors, graphic designers, photographers and content creators. This product may just be a viable alternative to the Apple Studio Display thanks to its features and capabilities.

The Samsung ViewFinity S9 is the direct successor to the Samsung ViewFinity S8. This was announced by Samsung in June of 2022. The preceding monitor was also designed for creatives and promised users that it will offer 98% coverage of the DCI-P3 color gamut. It also promised a matte display, along with an “ergonomic design.” However, the monitor only offered a 4K resolution.

The Samsung ViewFinity S9 tacks on new offerings to the Samsung ViewFinity S8. It is the brand's first-ever creator-focussed display, which offers 5K resolution (5120x2880 pixel resolution). This is claimed to improve colour accuracy. It also promises 99% coverage of the DCI-P3 color gamut along with an average Delta E of less than 2. Samsung

claims that these new features have resulted in a display that offers true-to-form, crisp details even in complicated or nuanced visual environments.” It will be interesting to see how it fares once it hits the shelves.

Accsoon SeeMo- use iPhone or iPad as viewfinder and storage device for DSLR

We saw a bunch of cool tech unveiled at the CES 2023, with many geared towards high-end consumers ready to transform their lives with futuristic tech. Now, one of the offerings that really stood out for us is the Accsoon SeeMo, a gadget that has been designed for creators

so that they can have a more productive shooting experience. The Accsoon SeeMo is a device that allows you to mount an Apple iPhone or iPad on your primary camera (such as a DSLR) and use the former as a display to see whether you're in the frame, and what the output looks like. This can be really

useful for those who rely on the flip-out LCD screens and don't have a second person directing them during the shoot. The idea is that you won't have to buy a specialised monitor and can save money by just using an existing Apple iPad or iPhone. You only need an HDMI cable to connect the device with your camera. Another appealing feature of this device is that you don't need to use the camera's SD card to save the recordings. They can, instead, be saved directly onto the Apple iPad or iPhone. You can then airdrop the raw files onto your Macbook and start editing. The Accsoon SeeMo price is \$179 which is around ₹14,736.90. It is available for purchase now. So, if you are someone who needs a monitor and additional storage for your camera, and own an iPhone or an iPad, this device could potentially be a game changer for you. Its efficacy still remains to be seen, but for now, on paper it does look like a solid deal that could help many amateur and professionals in their workflow.
