

Snapdragon 8 Gen 2 vs Apple A16 Bionic

Will 2023 be Qualcomm's year?

Sushant Talwar | sushant@digit.in

2

2022 was a mixed bag for mobile phone chip makers. While Apple and MediaTek impressed with their flagship SoCs, both Google and Qualcomm did underwhelm a little with their high-end offerings. Of the two, the latter has already come out with a new product in the form of the Snapdragon 8 Gen 2, which on paper at least promises to right the wrongs of the Snapdragon 8 Gen 1 and the 8+ Gen 1 chips the company launched last year.

Despite being very early in its life cycle, the Snapdragon 8 Gen 2 is already available on about 10 phones. Only one of these has made its way to India – the iQOO 11. This new flagship has given us

curious folks at Digit a chance to gauge this chip's performance and also compare it to the current leader in mobile SoCs, the A16 Bionic.

What's the Snapdragon 8 Gen 2 all about?

Before we get into comparing the new Qualcomm SoC with the A16 Bionic, let's try and understand what the Snapdragon 8 Gen 2 mobile platform is all about.

Currently the most powerful SoC available for Android phones, this Qualcomm chip has been fabricated using TSMC's advanced 4nm process for improved thermals and efficiency. In terms of architecture, it's not too different from

last year's high-end Snapdragon chipsets. This is because the Snapdragon 8 Gen 2 mobile platform also integrates four CPU cluster architecture where there's one big prime core based on the ARM Cortex-X3 architecture clocked at up to 3.2 GHz. The second cluster gets two ARM Cortex-A715-based performance cores clocked at up to 2.8 GHz. These are paired to the third
