Electronic Literature and Artificial Intelligence

If you haven't been living under a rock, then you must have heard about AI content and art generators like Dall-E and ChatGPT. As these AI-powered content generators are seeing an increase in popularity, there has been a call from artists all over the world to regulate their use by the general public as they feed off the IP of the artists.

However, to make the most of the situation, the folks at IIT Kharagpur, one of the premier engineering institutes of India, have formulated a course

that is centered around the art of digital storytelling. Titled,

Electronic Literature and Artificial Intelligence: Theory and Practice of Digital Storytelling, the course is set to bring a change in the way we see storytelling and its relationship with AI in the current scenario. The institution has accepted the proposal for the course, and it will be interesting to see the impact it has in the coming days!

Hydrogen Valley Project

When it comes to sustainable energy, India is one of the few countries that has made significant progress in integrating that into its own systems in the last few years. And, with the Hydrogen Valley Project, the Department of Science and Technology of the Government of India wants to demonstrate the country's ability to produce and use oxygen as an energy source locally.

In an attempt to give a boost to the development of the Hydrogen Valley, the Department of Science and Technology has called for proposals, as a part of the activation part of the project, starting in 2023. The project will focus on the following key areas:

- Hydrogen Production
- Hydrogen Storage and Distribution
- Hydrogen end uses – For transport and clean heat and power

With the start of the first phase of the project, it will be interesting to what state it ends up in 2023, and if private stakeholders also get on board to help make a change.
