

Chennai Startup's Bio 3D Printer Prints Human Tissues

Well, if you thought that the country had fallen behind in terms of technological innovations, then we'd recommend that you reevaluate your thoughts. A startup from Chennai, called Avay Biosciences, was recently successful in 3D printing a heart.

While similar feats have been achieved by researchers in other countries, which would make this breakthrough seem not so special. However, since such developments are taking place in our own backyard, future medical procedures could potentially be much cheaper and easier to perform, saving the lives of thousands of people. The state-of-the-art 3D printer used by the folks working with Avay Biosciences could be the key to India's entry to the global stage of deep medical science and research and developments in the world of medical tech.

Indian Urban Data Exchange (IUDX) Project

Urban development, planning, insight development has been a massive challenge in India for all the stakeholders. And, much of it has to do with the complexity and the amount of data that is generated year on year from urban spaces in the country. While it stores boat loads of information for policy makers, they often tend to miss out key details, just because of the loss in translation.

To solve this issue, the folks at the Robert Bosch Centre for Cyber-Physical Systems (RBCCPS), at the Indian Institute of Science, Bangalore, have launched the IUDX Project.

As per the developers of this project, it aims at targeting a various set of diverse problems that one can come across in an urban space – “From managing a green corridor for emergency vehicles to solid waste pickup and health management information systems – IUDX presents a greater opportunity for data-driven innovations.”

Gaming galore!?

If you are someone who is into eSports, trying to build a career around it in any capacity, then you must be aware of the fact that the Government of India, recently recognised eSports to be a part of multisport events. Everyone on the internet went crazy, celebrating this announcement.

Now, it seems like there is even more reason for Indian gamers to celebrate, as a new study has shown that the Indian gaming scene could potentially add 1,00,000 in FY23. IF this was not enough, then it has also been predicted in the same study, that in the span of just seven years, the Indian gaming industry is expected to attract Rs 780 crore in foreign investment, and grow by seven fold! This means that there would be a multitude of different avenues opening up for gamers, managers, casters, and the likes to expand their horizons and turning to gaming as a full-time job!

Aurora

A team of BTech, MTech and PhD students at IIT Delhi with a background in CSE, and experience in fields of aeromodelling, robotics, autonomous systems, computer vision, etc have come up with the Aurora project that has been doing rounds in the Indian tech space for some time now.

As stated by the researchers and developers involved in this project, “The goal is to create an

intelligent UAV with capabilities such as autonomous flying, navigation, and landing, as well as the ability to perform complex tasks such as automatic airdrop, detecting and localising targets of interest, reaching a specified position or target, and so on, with manual remote controls.” The Aurora project is the brain child of some of the brightest minds in India, and continues to grow one plane at a time towards achieving its ultimate goal, and it would not be surprising to see it all come together in 2023.
