

Top tech trends to look forward to in 2023

There are a lot of neat things to look forward to in the coming year

Aaryaman Dahiya | feedback@digit.in

A lot of the technology listed below already exists in the market and you may have already used some of them in one way or form. But in 2023, we expect many of these technologies to be refined for mainstream adoption. In this article, we cover everything from the Metaverse to sustainable technology and it's a wide array, indeed! So, let's just get started.

Metaverse

The term 'Metaverse' is used to typically describe a virtual world wherein people can do pretty much the same things you do in real life.

Metaverse is a technology which is in its nascent stages and businesses and their leaders are still trying to figure out what it is and how it can be used in their own favour. Its development is at such a stage that this year may change that completely. There is a certain belief that advertisers and marketers will be able to give the push that the metaverse requires to gain popularity. Consumers are always willing to interact in a better way with a brand depending on how the brand advertises itself.

Metaverse may develop this year to be a marketing channel. One can already see this happening in its early stages as businesses like JP Morgan and

HSBC and fashion brands like Gucci have already started building a certain metaverse presence.

There is also the corporate metaverse. A corporate metaverse is supposed to function like a Digital Twin (more on this later), in the sense that it will be like the complete digital replica of a company to help in increasing its efficiency. Accenture has developed an environment on metaverse that it calls 'The Nth Floor' that has replicas of real-world offices that it already uses by letting employees and new-hires conduct HR-related activities while providing access to anyone from anywhere.

ChatGPT 4 and AI Chatbots

ChatGPT 3 was a big revelation to the world about the progress of machine learning and AI language models. But, its successor, the ChatGPT 4 is anticipated to be bigger and smarter. It is said to sport 100 trillion parameters as opposed to the 175 billion supported by ChatGPT 3. That will mean more faster and accurate results for user queries ranging from text generation, text translation, text summarisation, etc.

We could witness wider use of ChatGPT and more AI chatbots inspired by its success. Even AI text-to-image
