

## Twitter Blue is alive!

November saw the prompt halt of the new subscription by Twitter called Twitter Blue. When it was initially launched, it cost around \$7.99 for iOS users and only included the blue tick. However, Elon and his mates have decided to take another shot at Twitter Blue. Twitter is back with a monthly \$8 subscription or \$11 if you're on iOS which will get you the much sought after "blue" tick mark on your profile and a bunch of handy perks. Those perks include the ability to try out new and experimental features like having a custom app icon and having the ability to organise your bookmarks in folders. You'll also be shown 50 per cent less ads than the regular users and you will also jump to the top in replies, mentions and search. However, this is not all. Twitter also announced some security checks and a change in the usage of the subscription service now so that people don't take advantage of it like last time. The first and the biggest thing to do in order to even apply for the service is having a verified phone number. Once you have that number verified, you can have Twitter Blue at your disposal but that comes with some conditions. Firstly, you will lose your blue badge if you change your username, display name or your profile photo and secondly twitter accounts which are more than 90 days old will be able to sign up for the subscription service. Changing your username or display name will send your account for verification by the Twitter team and once your account has been verified you will be able to show off your blue tick again.

## RIP React-Router?

If you have been developing in React for a while, you must be familiar with the npm package - react-router. It is a package which allows React developers to use and manage different routes in their web application. Now, if you have used TypeScript before, you know for a fact that it greatly improves the developer experience and almost eliminates all the bugs and undefined behaviour in your JavaScript code and hence TypeScript has been pushed everywhere. But the one thing that was still relatively untouched and not type-safe was the routes in a SPA. If you want to change one route, you have to change all the instances of that route over all of your pages and if you forgot to change even a page or two - that could very well lead to massive bugs. This problem is now being solved by TanStack Router. According to the website, Tanstack Router is a fully typesafe router with first-class search-param APIs and built-in caching, built for JS/TS, React, Preact, Solid, Vue and Svelte. Firstly, you can create the configuration of your router before you actually use it. This config will have all of the routes, query params and even the search params pre-defined. Hence, when you go to wrap your whole application within the router provider, all of the links that you will use will be completely type-safe.

## Stack Overflow bans ChatGPT

Ever since ChatGPT was launched on 30th November 2022, it has been revered by people a lot. ChatGPT can flat out write a whole code snippet for you if you just provide it with a problem statement, it can also correct your code and give you an explanation on why your code was wrong and what can be done to fix it, and it can also serve as a means to search out different functionalities of different programming languages. Surprisingly, it is really good at doing all of those things. You see, if there's one place that a developer can go to sort out all of the above problems, that place is Stack Overflow. That website has

been helping millions of developers around the world with all the helpful answers and forums that it has but after the arrival of ChatGPT, things just took a turn for the worse. People actually started copy pasting the answers from ChatGPT to Stack Overflow. This would generally be fine since the community was being helped via this approach but the big loop hole here was that ChatGPT wasn't correct all of the time. People were taking these faulty answers and pasting them onto the open forums of Stack Overflow.

Hence, Stack Overflow decided to step in and they had to temporarily ban all the answers that were copy pasted from ChatGPT from the ENTIRE PLATFORM. The Stack Overflow staff mentioned in their blog post "Overall, because the average rate of getting correct answers from ChatGPT is too low, the posting of answers created by ChatGPT is substantially harmful to the site and to users who are asking and looking for correct answers." This ban is temporary and the final policy for ChatGPT based content has not been decided by the Stack Overflow staff yet.
