

be refined in the Select and Mask workspace, allowing users to perform various adjustments.

## One-Click Delete and Fill

In the latest version of Photoshop, you can now easily remove objects from your images. With the new one-click Delete and Fill feature, you can delete an object, and the space behind the object will be automatically filled by Photoshop and will blend with the background. In order to use this, select the Object Selection Tool and either press Shift + Delete (on macOS) or Shift + Backspace (on Windows).

In case you're working with the Lasso Tool, after making the selection, simply right-click on the selection and select Delete and Fill Selection to remove it. This feature even works on pictures that have a set of complex backgrounds.

## Invite to Edit

With the improved and updated Invite to Edit feature, you can share a link to your Photoshop Cloud document and have as many collaborators as you want. The feature allows asynchronous editing, and each collaborator can edit a shared cloud document, one at a time. In order to use this feature, follow these steps:

Open a cloud document in Photoshop > Share > Invite to Edit > In the panel that opens, add the collaborators by adding their email addresses > Click on Invite to Edit.

Now you can work on a Photoshop Cloud document with other collaborators and also discuss it in the comment section of the document.

## Adobe Lightroom

Adobe Lightroom is widely used for

importing, saving, viewing, organizing, tagging, editing, and sharing large numbers of digital images. It can be

used to edit images on mobile devices as well as desktops. It is available on Android and iOS along with a desktop app. In the latest version of Lightroom new features were added. Let's look at some of them:

## Content-Aware Remove

Having unwanted spots in an image is very frustrating and sometimes, removing those spots is a hassle and can also damage the photo. In the latest version of Lightroom, you can

use the new Content-Aware Remove tool to remove these unwanted spots and objects in a photo by sampling content from other parts of the image. To use this tool and remove unwanted blemishes, follow these steps:

Go to the Healing panel > Select Content-Aware Remove > Define the Size and Opacity of the brush > Click and drag the brush over the areas you want to heal. To remove the changes and adjustments, click on the Reset button in the menu.

## Automatically Select People, Objects, and Backgrounds in a Photo (Desktop Only):

You can now individually select people, objects, and backgrounds in an image. This can help you to edit specific parts of the image with much more efficiency. This is how you can use it:

## Select People

Select People in the Masking

panel lets you make precise adjustments to one or more people in an image. This is how to do it:

Go to Masking > People > Lightroom will automatically detect all the people in the image > Specific parts of the body can be selected and enhanced > Click on Masks Panel > Select Add/Subtract masks if you want to add or subtract from the mask > Use editing sliders on the panel to the right to make adjustments.

## Select Object

In order to select the objects in an image and make adjustments, follow these steps:

Go to Masking > Select Objects > Select one of these two - Brush or Rectangle Select > Click on Masks Panel >

Select Add/Subtract masks if you want to add or subtract from the mask > Use editing sliders on the panel to the right to make adjustments.

## Select Background

In addition to the Subject and Sky masking features, you can now automatically

select a background in a photo and make complex adjustments to the selection. In order to do this, follow these steps:

Go to Masking > Select Background > Click on Masks Panel > Select Add/Subtract masks if you want to add or subtract from the mask > Use editing sliders on the panel to the right to make adjustments.

## Easily Compare Photos While Editing (Desktop Only)

Editing photos and not being able to look at the source in order to make comparisons can be quite a chore sometimes as you have to keep opening the original photo multiple times and look at the differences during editing, but in the new version of Lightroom, you don't have to do that anymore. You can now edit photos in Compare view using all of the edit controls. This feature allows you to compare your photos side by side as you make edits to them. **1**
