

Battery king, but needs replacement

iPhone, over the years, has been known to be notoriously difficult to repair, with Apple throwing their hardware ID restrictions in place. However, it is not hard to replace the battery of your iPhone, which would definitely fall below its peak capacity over time. You are greeted by this weirdly L-shaped monstrosity as soon as you remove the screen of your iPhone. To separate it from the chassis of the phone, first, you need to remove all the connecting ribbons. In order to get to the connectors for those cables, you will need to remove the metal plate labelled “A16 Bionic” which is held in place with eight screws. After removing the screws, lift the plate away and pop open the connectors using the spudger. Next, remove the plate covering the loudspeaker that is held in place by four screws. Disconnect the taptic engine, and remove the two screws holding it down. Now, all you need to do is locate the pull tabs and pull. Once all the four tabs have been removed, the battery will pop off.

The cameras

When working with the cameras of the iPhone 14 Pro Max, you need to be very careful. To remove the front camera system, first you need to remove the screen and the earpiece speaker. After they have been removed, you will need to trace the ribbon cable coming from the front camera module. Pop its connector gently using the spudger tool. Then take the tweezers and lift the front camera module off. Now, if you want to remove the back camera module, the first couple of steps with the screen and the battery remain the same. You will need to remove the silver metal plate covering the camera system. There are six screws in total that you'll need to remove. Once they are out, lift the plate, and trace the ribbon cable connecting the cameras to the main board. Pop it off using the spudger, and use the same to gently lift the cameras off. Once they have been lifted, take the tweezers and pull away the three-camera system of the iPhone 14 Pro Max.
