

approach with its design. The smartphone has a proper flat-edged design both up front and on the back. The edges are also completely flat. The back panel has a matte-like finish, but the Nebula Blue colour here doesn't look as classy as the Redmi Note 12 5G in Frosted Green. The back panel is absolutely flat, and there is no camera module as such. The two cameras and the LED flash module protrude out of the back panel itself. The volume rockers and power button are placed on the right side of the frame. Same as the Redmi Note 12 5G.

Up front as well, things are new. Realme has put a "bezel-less" LCD display with 1mm bezels and a slight chin. Up front, the thing looks almost unreal, with the almost bezel-less implementation, but the chin on the bottom slightly hinders with the whole full-screen feel that Realme was going for. The smartphone is also super

bottom of the front panel. One thing to mention here is how impressive it is that Realme has been able to make the bezels so thin with an LCD display, since LCDs are not as flexible as an AMOLED panel.

Performance

In terms of performance, both the Redmi Note 12 5G and the Realme 10 Pro 5G come with Qualcomm chipsets. While the Redmi Note 12 5G is powered by the newer Snapdragon 4 Gen 1

difference of more than 50,000 points. On Geekbench, however, the difference was slightly less. The Realme 10 Pro 5G scored 683 points in the single-core test and 2016 points in the multi-core test. The Redmi Note 12 5G, on the other hand, scored 610 points in the single-core test, and 1,849 points in the multi-core test. Further, in the PC Mark Work as well, the Realme 10 Pro emerged winner with about 477 points above the Redmi Note 12 5G's score of 10,169 points.

While the benchmark scores aren't miles apart from each other, the Redmi Note 12 5G wasn't able to run certain GPU-based benchmarks like 3D Mark and GFX Bench. We are not sure if these have been blacklisted by Xiaomi or if we encountered an issue, but we weren't able to put the Redmi Note 12 5G head-to-head against the Realme 10 Pro 5G when it comes to these GPU tests. On Gamebench, the Realme 10 Pro 5G showed a better frame rate and stability as compared to the Redmi Note 12 5G.

During your average everyday use, the Realme 10 Pro 5G offers faster performance. I found the app-loading to be slightly quicker as compared to the Redmi Note 12 5G. Now, this difference is only marginal and makes no impact if looking at it from a daily user's perspective, but head-to-head, the Realme 10 Pro 5G opens apps and switches between them quicker. This is mainly because of the higher RAM on the Realme 10 Pro 5G.

During gaming as well, the two smartphones echoed their respective benchmark performances. The gaming experience on the Realme 10 Pro 5G is much better. The graphic rendering is

lightweight just like its competitor, with both weighing at the same 189 grams each.

Coming to size, both the Redmi Note 12 5G and the Realme 10 Pro 5G are similar in size. While the Realme 10 Pro has a marginally bigger 6.72-inch display as compared to the 6.67-inch display of the Redmi Note 12 5G, the Redmi Note 12 5G is bigger in overall dimensions - both in terms of how tall it is and how wide it is. This is mainly because of the Realme 10 Pro's bezel-less display that leaves next-to-no borders except the chin on the

bottom of the front panel. One thing to mention here is how impressive it is that Realme has been able to make the bezels so thin with an LCD display, since LCDs are not as flexible as an AMOLED panel.

Both the Redmi Note 12 5G and the Realme 10 Pro 5G run on Qualcomm's 6nm chips. However, both smartphones perform quite differently even if we don't factor-in the extra RAM in Realme 10 Pro 5G. In performance-based benchmarks like AnTuTu, GeekBench, PCMark Work, Gamebench and more, the Realme 10 Pro 5G scored more than the Redmi Note 12 5G. On AnTuTu, the Realme 10 Pro 5G scored about 415,566 points, while the Redmi Note 12 5G scored 363,836 points. A
