

of the watch. There is an overlapping disc effect on it, which is a nice design choice. Before we move to the next section, know that the Dizo Watch D Pro also has IP68 dust and water resistance. That should be reassuring from a durability standpoint. With that sense of confidence, let's turn the lights on.

Click the crown to light up the 1.85-inch TFT display that dazzles with 600 nits of brightness and 240x280 resolution. Dizo underlines the 60Hz refresh rate and be it because of that and the light software inside, the animations and swiping experience feel snappy. You have to tap on the crown or raise the watch to activate the screen. Tapping on the screen does nothing. Further, you can swipe right to get to various tiles like Activity rings (very Apple-like), heart rate, weather, and music control. Meanwhile, swiping left from the homescreen takes you to a smart glance at Daily Brief, alarm, heart rate, and SpO2 readings. Press and hold on to the main screen to enter the gallery of watch faces. There are 5 available on the watch while you can download and replace with a choice of 100 backgrounds. Check the Dizo Health app for this. Moreover, swiping up from the main screen shows the quick toggles (Do Not Disturb, Low Power Mode, Bluetooth Calling option, Brightness Levels, Raise To Wake) and the Settings button. From the watch, you can tweak and toggle Display, Watch Face, Reminders, Battery, and General settings. The number of options is limited and basic as you would expect out of a watch in this range. Let's now see how it performs for the price.

Dizo Watch D Pro comes with over 110 sports modes and I have used Free Training, Strength Training, Indoor Cycling and Outdoor Walk. The lattermost wasn't working correctly; even with all the permissions granted, GPS wasn't always locking accurately. There have been times when the Dizo watch shows 0.3/0.8 km for a 750-meter route. Other times when it decides to work, there will still be some disparity in the data, like a difference of 100 meters and the map doesn't show the actual route taken. Other than that, I kept count of stats like calories and heart rate during workouts. Again, the former had some accuracy problems. But, the average BPM count was reliable. Dizo claims 7 days of battery life without the calling function and one less with it. In my usage, the actual runtime was short by a

couple of days. Two-hour use of it drains the battery by 6 per cent. Although not close to the claim, the RTOS and single chip offer a reasonable runtime. It should fare better for folks who don't like taking calls on their watch. When it comes to charging the thing, the bundled magnetic suction charger takes about 1 hour and 40 minutes to fill the tank full. Again, good.

Dizo Watch D Pro is a decently built, brightly lit, nice-looking smartwatch that features the basics you would expect out of a watch at this price. However, some of those things like the actual tracking and battery life leave you wanting more. The activity tracker is a little finicky and the 4 days battery life is passable at best. But if those things suit your mileage, then Watch D Pro might just be the smartwatch for you. **d**
