

Want to make better TV buying decisions? We're here to help!

Sushant Talwar | feedback@digit.in

has more pixel crammed in per inch, you can sit much closer to the TV, and as such accommodate a slightly bigger panel TV in the room if you need to. As such for a 4K TV, this size-to-distance multiplier should be 1-1.5 times the size of your TV.

HD-Ready is not Full HD

On that note, the second pro tip from us would be to ensure that you don't fall prey to the marketing trap of the HD-Ready TV – especially if you plan on watching a lot of OTT content on the TV. While HD-Ready may make you believe that your TV can play high-definition content that you can stream through popular OTT platforms, know that the reality is very different.

Instead, what you should be looking for is a Full-HD TV if high-definition content is what you're looking to play on your TV. On a HD-ready TV, this content is played by downscaling the resolution of frames on the TV to 720p, which is still better than SD content that runs at 480p, but not high-definition.

Avoid falling for the 8K trap

Another big marketing gimmick that you're better off avoiding, for now, is the 8K trap. While it is true that 8K resolution is definitely much better compared to 4K – an 8K TV is capable of displaying 4 times more pixels on screen – it may still not be a technology you should be investing in at the moment.

For the here and now, none of your current-gen consoles are unlocked to support the high resolution while

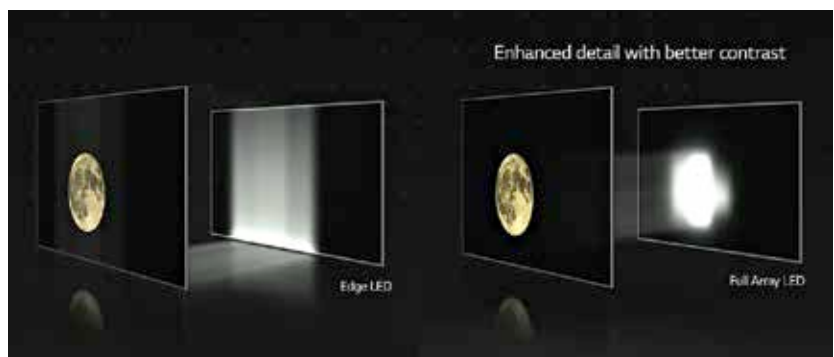

With an abundance of options across budget segments, there has never been a better time to finally make the plunge and get yourself a new TV. However, with many options comes many many confusions, and worse, a lot of unnecessary jargon to decode and maneuver through. So read on to know a few tricks to avoid making some basic mistakes and spending more than you need to on your next TV.

Bigger is not always better

So one of the major pitfalls I'd recommend side-stepping when buying a new TV is to not go looking for the biggest TV that fits in your budget. Despite some TV makers telling you otherwise, a bigger screen TV does not necessarily translate to better TV viewing experiences. In fact, fitting a bigger TV in your room than it can accommodate will only end up working against you.

Now the funny thing is, choosing the right-sized TV for your room is not as straight forward as figuring out how big the wall behind it is. Rather, it depends on the distance that you're going to be viewing content on the TV from and also the native resolution of the TV you're buying. So if you're buying a Full-HD 1080p unit, the TV size to distance ratio should be around 2 times the size of the screen. Now because a 4K TV's panel
