

LAPTOPS AND PERIPHERALS

Don't get distracted by the bling

Manish Rajesh | manish@digit.in

save you some money in the long run. However, this does not mean that you have to spend an arm and a leg, and possibly a kidney, to get the best laptop out there. There will definitely be a more budget option out there that can serve your needs just fine. Of course, if price is no issue, then this probably doesn't matter to you. In fact, there might even be a cheaper option with the very same hardware specifications. This is why research is important.

High resolutions don't mix with small screens

Unless you specifically require a laptop with a high resolution display, in most cases you can safely ignore those. Sure, higher resolutions look clean and crisp, on larger displays. Laptop screens can range from 11-inches to 17-inches, and in most cases, you won't even be able to tell the difference. So unless you work in a creator field and you need a high resolution display, a 1080p or FHD is really all you need.

Size doesn't mean anything - Just kidding

Most people buy a laptop for its portability. While it might be tempting to go for the laptop with the largest display, consider that this makes the laptop harder to carry around. Smaller laptops are lighter and easier to fit into bags. They're also usually slimmer. On the other hand, a bulky gaming laptop is heavy and a pain to carry around. They're not usually carried around and stay plugged in most of the time. So once again, it comes down to picking the laptop that best suits your needs.

GPjUice

The first and foremost thing you might want to consider when buying a gaming laptop is whether or not it has a dedicated GPU. A GPU or graphics card exists to take some load off the cpu and allows you to run for graphically intensive and demanding games. It's not just games, but a GPU can increase your overall productivity with a laptop, improving your editing speeds and such

When there's no dearth of options in the market, it becomes important to do your research before making a purchase. This is especially true if you're about to make an expensive purchase, something like a laptop for instance. This particular section of the cover story will cover more than just laptops though. We'll also take a look at all the marketing jargon that you should avoid when you're looking to buy a gaming mouse, gaming keyboard and gaming headset as well. It's easy to get distracted by all the bling in the market, but it's important to look beyond the bling and pick out the product that best serves your needs. With that out of the way, let's get started with laptops.

Things to be aware off when buying a laptop

Cheapest $\neq$ best

Don't just go for the cheapest available

market in the laptop. If you were in the market for a laptop in the first place, then you probably had an intended use for it, be it gaming, or office work or even just to consume content. It's important to do your research first before you buy a laptop, to at least ensure that the laptop can actually do whatever it is you expect from it. You might want to invest in a laptop with decent amounts of RAM if you plan on multitasking a lot, or a laptop with a dedicated GPU if you plan a game, or a laptop with a decent display if you plan to consume a lot of content. So keep all of that in mind when you make your decision.

Most expensive $\neq$ best

The same applies to the other end of the spectrum of while. It is always advisable to purchase a future proof product, i.e., purchase a laptop that you know will serve your needs for the coming few years. This might mean you need to splurge a bit more but it will certainly
