

**Q Sweet choice of CPU + GPU combination, but why hold back on the RAM, this beast deserves 64GB.**

**A** We believe that for most modern games, to run even at 4K resolution, 32 GB RAM is good. Nevertheless, the customer can always upgrade it to 64 GB as we have provided that option.

**Q On the same lines, this should have been an all-SSD desktop. A 2TB PCIe Gen4 would have done justice to the config. This question comes from the Digit Gamer Community, and I echo the same.**

**A** This product supports up to 4TB of Gen 4 SSD and we will explore bringing a 2TB alone option in the future. We have seen costs of SSD coming down in the market and it may reflect in the future gaming desktops from Alienware.

**Q What kind of unique software optimizations and overclocking features does the Aurora R15 offer, especially given the custom design and choice of components?**

**A** The Alienware Command Centre provides extensive customization and overclocking capabilities for the Aurora R15. The device features an unlocked Intel K series CPU that can be overclocked, and the memory can also be upgraded to XMP and overclocked. The GPU overclocking options are also available through the Command Centre. The application offers performance modes including a unique high-performance mode that enables all of this, and most importantly, sustained overclocking over periods of time, which is key. In essence, it's not just about overclocking for the sake of it, but we need the performance to sustain over long periods, and with the new cooling solutions on offer, can be achieved on the Aurora R15.

**Q What elements of the Alienware DNA are percolating down to Dell's other gaming products?**

**A** Alienware DNA is always at the core and there are four key aspects when

any Alienware products are designed. The fundamental brand tenets include

- **Innovation.** We want purposeful innovation for gamers - things that will improve the experience of our community
- **High performance.** Everybody associates Alienware, the 26-year-old brand with the best performance. We make the best-performing products in the industry in its class
- **Premium.** Materials synonymous with Alienware inside and out, are the best. One can always expect quality from Alienware, and you'll never be disappointed by that - in every single product that we make
- **Iconic Design.** An Alienware laptop or a desktop in a room needs to stand out from every other product from any other brand and I think we've been very successful with that, with our legendary DNA. Innovations are first brought to Alienware and then they translate to our gaming range under the G series. To illustrate, we introduced Element 31 thermal interface material as a proprietary cooling solution for our Alienware notebooks a couple of years back, which will percolate across our gaming series. Similarly, we had the best-in-class displays debuting on the Alienware, for instance, a 240Hz display with a QHD panel with 100 percent DCI-P3 last year. Drawing an analogy, Alienware is like Formula One - which is where all the innovations happen, after which they permeate into our other gaming series. The Dell G15 - while it is affordable as a product to the customer, it is as capable of a machine as an Alienware device when it comes to thermal performance. What's also important to note is that no matter what trickles down to other devices, the performance is something that is never compromised.

**Q Given the ultra-premium price point, are there ways in which gamers can experience the Alienware Aurora R15 before buying**

**one? Like an experience zone of sorts?**

**A** The Alienware Aurora R15 is available for purchase at the premium Dell Exclusive Stores and Dell.com. Consumers can visit these stores to experience them hands-on. Furthermore, we are always creating new touchpoints for consumers and enhancing their experience.

**Q How would you describe the Aurora R15 buyer? If there was a persona that Alienware had in mind when working on the Aurora R15, what would it be like?**

**A** The Aurora R15 caters to enthusiasts and young metropolitan gamers. The profile of gamers includes the ones who want to play AAA titles at 4K resolution consistently without frame drops, over long periods, and at higher than 60 FPS. We are also targeting professional content creators who need to execute high-end video editing. Simply put, a high-end content creator who is into editing 4K videos, editing multiple videos, 3D rendering, and/or high-end content creation and streaming. While the affluent enthusiast becomes the core, the purpose this device solves is consistent 4K gaming while also streaming and top-end content creation. Tantamount to the Alienware community, this device represents users who opt for no compromise and superlative performance.
