

TikTok-style news, Chromium catches Rust and Google forays into AI music

Here are the biggest developments this month

Kshipra Jadav | feedback@digit.in

Google's New Venture Into AI Generated Music

While the world is drooling over text based AI applications like ChatGPT, Google and their AI development team has come out with a new way to implement and integrate AI into a completely new field. MusicLM is Google's venture into the world of generative AI. This is a text to music AI service which means that just like you ask DALL-E to generate an image based on a text prompt, or you ask ChatGPT to generate text-based response based on a text prompt, MusicLM can generate full length music pieces and melodies based on a text prompt. Aside from doing this, it can also convert a whistled or hummed melody into other instruments. This basically means that you can literally hum "Never Gonna Give You Up" into this and get that played by different instruments like a Bass Guitar or Flute.

TikTok but for News?

Instagram's co-founders Kevin Systrom and Mike Krieger are now venturing into social media once again. Both had left Facebook in 2018 due to some tensions in the parent company. Now, they're back with another social media app called "Artifact". But this social media app is not like other social media apps/websites which let users share their personal photos and videos with the world. This is a News social media app which will let users browse through news articles and share them with their friends. The unique thing about this app is that it will use Machine Learning to tune the front page feed according to the interests of the user. The app's two main features are in beta right now. One feature will let the users talk to each other via direct messages and the second feature will allow users to see posts only from the creators / users that they have chosen to follow along with their personal commentary on it. The app is in private beta right now but you can join the waitlist on <https://artifact.news/>

The Old New HomePod

Apple is back with the original HomePod design with its new revision - the new HomePod. This boy goes for \$299 and looks identical to the first generation HomePod. But that's where the similarities end. The new HomePod features a display that covers the entire top, making it bigger and better in terms of displaying content on it. It now has a removable power cord! The first generation had a non-removable power cord

which left a sour taste in many buyers' minds. The cherry on the cake is that this power cord features a standard 8-pin connector. So, even if you lose the original power cord, you will be able to replace it with a regular 8-pin power cord. In terms of the sound, there are subtle hardware improvements, but if the initial impressions are anything to go by, this one sounds identical to the first generation. If you were a fan of the first generation, you will like this one.
