

interface that could allow basic edits and then upload directly from the camera.

A The demand for enhanced connectivity is already happening, it's a continuously iterative process. But the requirements vary from customer to customer. A customer from media houses may be different from a customer who mainly covers weddings, for instance. Nowadays things are going digital, so media consumption is immediate. So that's why I think these things will definitely come up.

Q Curious to know more about Nikon's entry into healthcare. Can you elaborate on that?

A Effective April 1, 2022 onwards, we have formed our healthcare vertical. It's not that we didn't have a presence in the healthcare segment earlier, because it was through our import partners or distributors. Now it is directly through Nikon India and we have a team in place not only at our head office but also several branch offices. So primarily we will be doing a biological range of microscopes primarily for educational institutes, research institutes and IVF labs for various other clinical purposes. So healthcare is one sector that I believe is doing well. Yes, we have our role in a limited space, but we are increasing our presence in that segment.

Q So if one of our readers went in for say a health checkup or any kind of medical procedure, where would they see Nikon technology being used?

A An IVF lab is one place where a customer can come across our technology. Otherwise, the students at educational institutes like IIT or AIIMS or any other research institutes can get a glimpse of Nikon's tech on biological range of microscopes or high-end optical systems.

Q What sector in the camera industry do you expect to see the most growth over 2023? The

amateur segment, the professional segment or the ultra professional segment?

A Traditionally what we've seen when we think of digital cameras it's only the professional cameras that come into our minds. But when it comes to numbers, I think the content creators and vlogger segment has seen very good traction in recent years, especially post-COVID I think camera sales among these customers has increased more. Most content creators start their content creation journey by capturing photos and videos from a smartphone. As they grow in popularity and follower count, content creators definitely migrate to proper still

Nikon Z50

cameras and video camera devices to offer a higher quality of visual content to their ardent fans and followers. It's at this point they might gravitate towards devices like the Z30 or Z50 which are quite affordable and easy to shoot with.

Q Can you share some insights into the Indian camera market? What's so unique about it and how do Gen-Z or younger customers jump from smartphone photography to the DSLR or mirrorless cameras?

A Yes, I mean, so there's no major jump from a smart device to a camera. Smartphones show continuous improvement in their camera sensor and megapixels, but image-making

or video-making is beyond just that – more and more people who get serious about great quality photo and video capture definitely understand this key difference. But that's not to say that smartphones aren't important, because smart devices are helping us to penetrate the market more because of a wide variety of customers' initial interaction with photography or videography through smartphone devices. So no doubt that now everybody's a photographer or videographer. But once we take this as a serious hobby or as a professional, certainly we go for proper equipment, and then that equipment helps us to achieve our creativity so that way the camera comes into the picture. When it comes to the Indian imaging industry, certainly considering our population base and the kind of opportunity we offer in terms of festivities, architecture and culture, there are many things that are photogenic and we want to capture across our amazing country. We have so many occasions that we want to capture as wonderful memories or for posterity, so there we see a lot of potential for even higher-end equipment as well as for those content creators.

Q We could say that the rise of the smartphone camera and shooting on the smartphone has in fact helped the camera manufacturers?

A I think that is right, because if that hadn't happened more people wouldn't have gotten into the habit of taking pictures and recording their memories and life's moments. Because of smartphones, everybody is getting exposed to clicking pictures. Of course, if you have that hunger to grow in a particular field of photography or videography, then certainly you will upgrade your camera quality in the future. But at least that first interaction for individuals is happening thanks to smart devices and that is having a huge penetration in our country and also across the world. **d**
