

INFOGRAPHIC

ABB Formula E Gen3 car

Specifications

Gen3 vehicle performance

TOP SPEED

322 kph / 200 mph

MAXIMUM POWER

350kW / 470bhp

RACE MODE POWER

300kW

0 - 100km/h

2.8 sec

MINIMUM WEIGHT

(including driver): 850kg

SUSTAINABILITY

World's first net-zero carbon race car

Key facts about the Gen3 Formula E cars

01

Power power power!

Each Formula E race car charger is capable of generating max power of 160kW and charge two 80kW vehicles simultaneously. That is like charging 800 phones with 200W chargers at the same time.

All this is made possible by the regenerative braking systems that are put in place at the back of these vehicles. When a driver brakes, the energy generated during the braking is cycled back to the battery. That is not it, depending on the charge of the battery, its temperature, and several other factors, this energy might get used in some other process altogether as well.

03

Efficiency is key, always

Third gen Formula E cars have a power efficiency of 95 per cent, compared to 40 per cent of the regular ICE cars. This means that not only are these cars greener from the get-go, but during their operations as well, these cars outperform the cars that run on fossil fuels as their primary fuel source.

02

Limited customisation

To promote sustainable racing and focussed and cost-efficient development of cars, the FIA, allows only two parts of the Formula E cars to be customised by the teams and developed specifically for their cars. These are the front dampers, and the powertrains. The rest of the car is the same across the teams, and a single car is to be mandatorily used by a team for a period of a minimum of four years.

04

Maaaaximum

Formula E cars used to have a max regenerative capability of 350kW, about 470bhp. However, the addition of a front powertrain, which contribute about 250W, and pushes the total to a whopping 600W!
