

matte and gloss finishes accenting the mouse. As per the claims made by Logitech, which we verified as well, the mouse weighs 102 grams, which is supposed to be lighter than before. There is a small circular plate at the bottom of the mouse, covering the dongle storage cavity of the mouse, held in place by fairly strong magnets.

The thumb rest of the mouse has a rubberised finish which feels great when you are using the mouse. It provides for additional grip, preventing the rather slippery mouse from going flying away from your hand when you hit those insane flicks in games. The PTFE Feet are the same that are featured in the other high-end Logitech mice like the Logitech G Pro X Superlight.

Features

When talking about the features of the Logitech G502 X Plus, there's a lot to talk about. So, let's start with the switches featured on this mouse.

One of the biggest attractions of this mouse, which helps it stand apart from the older G502, is the new kind of hybrid optical-mechanical switches that have been added to this mouse. According to the brand, these new switches "achieve higher levels of speed and reliability as well as retain the crisp actuation of mechanical." In our time using the mouse across a variety of game genres, at no point did we feel like the buttons were slow

or unresponsive. The click and feedback was also quite satisfying.

Then, there is Logitech G Hub, which is the software you can use to control and customise the various functions and lighting modes of the mouse. The DPI shift button allows for on-the-fly changes to the DPI, and Powerplay integration means that you can use the mouse forever without ever needing to charge it as long as you have a Powerplay enabled mousepad to go with the mouse. These aren't available in India yet unfortunately. Via the software, you can map well over 15 actions to this mouse.

The Hyperfast scroll wheel, which can be toggled to ratcheted or free-flowing states by the click of a button, ensures that you don't need to exercise your index finger a lot when scrolling long Reddit threads or pulling off those insane bunny hops. Additionally, if you are someone who owns tons of Logitech peripherals that are compatible with Lightsync RGB, then you are in luck. This mouse also supports Lightsync RGB, meaning that you will be able to colour-match the LEDs on your peripherals.

Performance

When trying to figure out how the mouse performs, one of the first things that we tend to look at is the sensor that the mouse is equipped with. So, when we saw the Hero 25K

sensor, which was featured in our Digit Zero1 Awards 2022, winning mouse, our expectations were high. However, the mouse could not match up to the performance of its cousin. In our testing, the response time of the G502 X Plus fell short of the one we found when we tested the G Pro X Superlight. It was off by 9 points, which might not impact the day-to-day

gaming activities of most users, but if you are someone who pushes your peripherals to the limit when gaming, then you will definitely feel the difference in the performance of the G Pro X Superlight and this mouse.

When we populated our scoring sheets to calculate the final performance score of the mouse, accounting for DPI difference, response time, Enotus Mouse Test, and other miscellaneous tests and metrics, there was a very small difference between the two mice. However, whatever difference there was, albeit something that most of you all would not notice, should not have been there.

Verdict

The Logitech G502 X Plus is a mouse that we would recommend to any gamer who is looking to upgrade their MOBA or MMORPG gaming setup. This is because the mouse offers an elaborate and awesome feature set, a good selection of buttons, excellent build quality, and a sensor that would put most others to shame. At ₹14,995, the G502 X Plus is pretty pricey. If you really want a wireless option, we would recommend going for the Lightspeed variant which is 1K cheaper. If you are someone who is into FPS games, we would recommend you to go for the Logitech G Pro X Superlight instead, which is an all performance, no-nonsense gaming mouse for those who like clicking digital heads! *
