iPhone SE 4 expected features are here

Apple iPhone SE 4 is reportedly back on the production floor. Reputed leakster Ming-Chi Kuo has claimed that Apple has restarted developing the SE 4 after a few months of doubt on the future of cheap iPhones. If this excites you, here are the expected features of the iPhone SE 4 based on previous leaks and rumours. Here's a look at the expected features of the Apple iPhone SE:

1. 6.1-INCH OLED DISPLAY

Apple could design the iPhone SE 4 with a 6.1-inch OLED screen. This will make it the iPhone SE model with the largest screen. This panel will be procured from BOE as per analyst Ross Young. This iPhone could look more like an iPhone XR.

2. APPLE-DESIGNED 5G CHIP

Apple could part ways with Qualcomm and use its own

in-house made 5G modem within the upcoming iPhone SE.

3. FACE ID

The fourth-gen iPhone SE could also offer Face ID as a biometric login solution while its predecessors have had Touch ID.

4. A15 BIONIC SOC

The rumours and expectations are that we could get an enhanced A15 Bionic processor inside the iPhone SE 4.

Rest, the iPhone SE 4 specifications could comprise a 12MP rear camera, perhaps a larger storage capacity with the base model, and a larger battery (because of the supposedly larger chassis). Since Apple Park is airtight in terms of accidental leaks and revelations, we will have to stick with these rumours and speculations for now. Do take them with a grain of salt though.

Features that could appear in the iPhone 15

Apple iPhone 15 Pro is expected to launch at the end of the year and we have received some design renders just now. The design of the iPhone 15 Pro has leaked on the internet based on a CAD model that is provided to factories in Asia by Apple to make the case of Apple's new iPhone 15 Pro. This means Apple wants the case ready when the iPhone 15 Pro rolls out. Apple's CAD files are very much accurate to real phones in terms of both dimensions and design. Apple has made some changes in the design of the iPhone 15 Pro in comparison to its predecessor iPhone 14 Pro. According to a report by 9To5Mac, a case manufacturer and 3D artist known as Ian Zeblo has shared the CAD design

of the iPhone 15 Pro with 9To5Mac. The major change in the design of the iPhone 15 Pro is the appearance of a USB Type-C Port in it. The next change which Apple made is the curves of the smartphone. Apple has increased the curves of the edges and display as well which resembles the design of the new 14-inch and 16-inch MacBook Pro and

new M2 MacBook Air. This change might improve the grip of the phone and reduce the chance of unintentional touch on the screen. The renders also show a slight change in the body with a very minor decrement in it with thinner bezels as well. The iPhone 15 Pro might feature the same 6.1-inch display but with a smaller body, retaining the dynamic island. Apart from that, the camera bumps also seem slightly thicker than before in the CAD files. Apple might change the physical volume rockers to capacitive ones. There could be a change in the mute switch as well. That's everything we know so far about the design of the iPhone 15 Pro and Apple has not confirmed any of these features.
