

displays, took a long hard look at the designs, and of course, took some pictures to see if the cameras are any good. Here's what we found out:

iQOO 11 vs OnePlus 11 vs Samsung Galaxy S23 Ultra vs Xiaomi 13 Pro: Design

Starting with the design, all the four Android flagships of 2023 have their own distinctive features. While the iQOO 11 comes with the BMW M Motorsport-inspired racing stripes design with the faux leather back panel, the Samsung Galaxy S23 Ultra has its now-iconic form factor which looks pretty much the same as its predecessor. The OnePlus 11 has the new round camera module implementation, and the Xiaomi 13 Pro introduces a new design language for the Xiaomi flagship series.

The iQOO 11 has arguably the least dramatic design. There is a flat hole-punch screen up front, and a faux leather back panel, with BMW M Motorsport racing stripes. These blue and red racing stripes have a glossy finish, and to add to the detail, you can see a carbon-fibre-like pattern inside the racing stripes upon looking closely. Very cool attention to detail. The rectangular camera cutout is placed in the top-left corner, which also has a two-tone colour scheme with both grey and black panels. The top and bottom of the aluminum frame are flat, which allow users to make the smartphone stand on any flat surface.

Overall, we liked the subtle design. While there are a couple of rough edges here and there like the screen not merging into the frame as seamlessly as its competition, the iQOO 11 is still beautiful. We loved the premium in-hand feel that comes with the faux leather back panel, and the smartphone is also one of the lightest among the four, making it easy to hold and carry.

Coming to the Samsung Galaxy S23 Ultra, the Samsung flagship has a very similar design as its predecessor. With pretty much the same looks as the Samsung Galaxy S22 Ultra, the Galaxy S23 Ultra's design change is more than

meets the eye. With this year's flagship, Samsung has made changes where it matters. The Galaxy S23 Ultra's edges are more flat now, along with the flat frame on the left and the right sides, similar to what we had seen on Samsung Galaxy Note devices before their demise. The curved display implementation is also slightly different this time around.

Now, while the design change is minor, the impact it makes is not. The Samsung Galaxy S23 Ultra is now easier to hold in your hands and the grip has improved. Given the sheer size of the S23 Ultra, this is a welcome change. The smartphone is still a bit too big for many users and the weight may also make things uncomfortable for many users.

With the OnePlus 11, we are witnessing a new design language from the brand. The OnePlus 11 has one of the more compact form factors among the four competing devices. We see a new round camera module with four cutouts for the cameras and the flash. The in-hand feel of the OnePlus 11 is proper OnePlus. The sandstone finish, the alert slider, all of it is very familiar with OnePlus, but we get it in a new shape now. The round camera module is something that may not have many takers, but the OnePlus 11 looks and feels like a proper OnePlus flagship.

The Xiaomi 13 Pro, which is the latest flagship from the Chinese OEM, also introduces a new design language. The Xiaomi 13 Pro has a curved display up front, with a hole-punch cutout in the middle. At the back, the smartphone has a square camera module, with the Leica-powered triple camera setup. Xiaomi has given a ceramic back panel on the 13 Pro, which looks and feels super premium. In white, especially, the black camera module gives the smartphone a 'Panda'-like colour scheme.

The size of the Xiaomi 13 Pro is also the best among the four competitors. It is handy, compact, and easily usable with a single hand. The one issue with the design, however, is the camera module's thickness. This is probably

the thickest camera module on any smartphone, and the Xiaomi 13 Pro slants when placed on a flat surface. The camera module also interrupts while playing games or watching videos. Furthermore, the Xiaomi 13 Pro is heavy. You may not feel the weight initially, but with prolonged usage, things get quite uncomfortable.

iQOO 11 vs OnePlus 11 vs Samsung Galaxy S23 Ultra vs Xiaomi 13 Pro: Display

With the display, it is not easy to give a verdict as to which of these Android flagships have the best display. All the four smartphones boast of 2K AMOLED displays, along with many other features. The iQOO 11 is the only display among these that supports up to 144Hz refresh rate, while the other three have a 120Hz refresh rate. Given that these are the top-tier Android flagships of this year, all of them are very good displays. But of course, there are differences, no matter how minor.

In our usage, the iQOO 11 display seemed the most saturated. The contrast is the steepest here, and the iQOO 11's display seemed to be over-doing the skin tones in most cases. Using the smartphone in vivid or saturated colour profiles makes the display's tone too warm and enhances reds a bit too much.

The Samsung Galaxy S23 Ultra, on the other hand, manages colours much better. This display is considered one of the best on any smartphone out there, and with good reason. We get a 6.8-inch WQHD+ Dynamic AMOLED panel with LTPO. While this display also has a slightly high contrast, the colour accuracy is much better as compared to the iQOO 11. We tested this display for colour accuracy, and it showed an average DeltaE of 2.4 in sRGB, which is very good. The maximum DeltaE was 4.3 on orange or saffron colours, meaning that orange or saffron are the least accurate colours on this display.

The OnePlus 11, which also has a QHD+ AMOLED panel also showed good results in our tests. Surprisingly, in the Calman test, the OnePlus 11
