

showed better numbers as compared to the Samsung Galaxy S23 Ultra in sRGB colour space, with an impressive Average DeltaE of 2.1. This means that the colours on this display are as accurate as it gets on a smartphone.

Coming to the Xiaomi 13 Pro, the latest flagship from the Chinese manufacturer showed better results as compared to any of the other competitors. The primary and secondary colours showed almost no error, meaning that this is as good as a display could get. The average Delta E was 1.74, while the max Delta E was 2.5. In grayscale also, the Delta error came out to be 2, which is very good for a smartphone display.

We can't talk about displays without mentioning the brightness. While each of these companies claim different levels of brightness, we tested it using a Lux Meter. According to that, the Samsung Galaxy S23 Ultra's display came out to be the brightest, with a maximum brightness of 1192 nits. Samsung is followed by the Xiaomi 13 Pro, which showed a peak brightness of 968 nits, followed by the OnePlus 11 with its 880 nits tested peak brightness, and the iQOO 11 came last with its 820 nits peak brightness, according to our Lux Meter test.

iQOO 11 vs OnePlus 11 vs Samsung Galaxy S23 Ultra vs Xiaomi 13 Pro: Performance

Performance is where all these four devices gave each other tough competition. On paper, things aren't too dif-

ferent among all four of these. The iQOO 11, OnePlus 11, Samsung Galaxy S23 Ultra, and the Xiaomi 13 Pro, all come with Qualcomm's Snapdragon 8 Gen 2 chipset. The Galaxy S23 Ultra, however, has a custom Snapdragon 8 Gen 2, which has the same architecture as the normal Snapdragon 8 Gen 2, but with a slightly higher clock speed.

Coming to numbers, things are close. Neither of these new flagships is a clear winner. For example, on AnTuTu, the iQOO 11 showed the highest score of 1,272,411, followed by the Xiaomi 13 Pro which scored 1,259,912 points. The Samsung Galaxy S23 Ultra came third with a score of 1,204,573, and the OnePlus 11 came last with a score of 1,045,248 on AnTuTu.

On Geekbench, things were again very close. While the Samsung Galaxy S23 Ultra had the highest single-core score, the Xiaomi 13 Pro showed the

iQOO 11 came third with 12,150 points, and the OnePlus 11 lagged behind here as well, with a 10,493 score.

Coming to GPU-based tests, in 3D Mark Wildlife, the Samsung Galaxy S23 Ultra again emerged winner with a score of 3781, followed by the OnePlus 11, which scored 3606 points. The iQOO 11 came third with 3,566 points, and the Xiaomi 13 Pro remained last here with just above 3000 points.

In gaming, all the four flagships expectedly performed great. We ran Gamebench Pro on all the four smartphones, and while all of them gave us a full 60FPS frame rate in all tests, the Samsung Galaxy S23 Ultra was the only smartphone that failed to give a 100% stability in both the games we tested on Gamebench - Asphalt 9 and Call of Duty: Mobile. Apart from this, the OnePlus 11 also wasn't able to achieve a 100% frame rate stability in Call of Duty: Mobile, maxing out at 97%, same as the Samsung Galaxy S23 Ultra.

highest multi-core score in this benchmark test (see graph below for all numbers).

In PC Mark 3.0, which is another CPU-based benchmark, the Samsung Galaxy S23 Ultra had the highest score of 15,530, followed by the Xiaomi 13 Pro's 14,778 points. The

iQOO 11 vs Samsung Galaxy S23 Ultra vs OnePlus 11 vs Xiaomi 13 Pro: Battery

One of the most important factors, battery. Battery optimization relies heavily on the chipset in a smartphone. Since all these smartphones run on the same Snapdragon 8 Gen 2 SoC, the battery numbers are also quite similar. However, there was one clear winner - the Samsung Galaxy S23 Ultra. While the smartphone drains battery a bit too
