

Samsung Galaxy S23 vs iPhone 14 vs Pixel 7: Cameras compared

We pit three of the best compact flagship smartphones' camera systems against each other to see which ones come out on top

Dhriti Datta | dhriti@digit.in

Hundreds of camera samples. Three compact flagship smartphones. Which one wins? Compact flagship smartphones may be a dying breed, but companies such as Samsung, Apple, Google, and a couple others have still kept the embers alive for those who prefer the ease of one-handed usage over screen real

estate. Even though these phones are diminutive in size compared to the almost 7-inch phablets in the market right now, some of their camera systems are no joke. In this comparison, we pit three compact flagship smartphones' cameras against each other. The phones are the Samsung Galaxy S23 (6-inch display), the Apple iPhone 14 (6.1-inch display), and the Google Pixel 7 (6.3-inch display). If you are scouring the market for the

compact phone that doesn't skimp out on powerful camera hardware, then these phones are your best bet. We roamed the streets of Mumbai, clicking hundreds of camera samples, to see which phone's camera system reigns supreme. Let's find out the results.

Daylight Shots

Let's kick things off with shots taken in the daylight. All three phones are capable of capturing fantastic, detailed photos, but since these are flagship cameras, we will be nitpicking a bit. By default, the iPhone 14 has a warm colour tone, the Pixel is warm as well but leaning towards neutral, and the Galaxy S23 has a distinct cool tone. Pictures taken from all three phones manage to uphold the integrity of the shot. In shots with the sky, its exposure is kept in check nicely. However, in
