

OnePlus TV Q2 Pro

Cover all bases for a select few

₹99,999

OnePlus started 2023 by launching the successor to its popular Q1 Pro, with yes, you guessed it right, a QLED panel. The only difference is that Q2 Pro is bigger, better in terms of specifications and offers a lot more in the features department when compared to the Q1 Pro. But the big question still remains, do all these combine to make the OnePlus Q2 Pro a good TV for 2023? Well, let's find out in our review of the all-new OnePlus Q2 Pro.

DESIGN

OnePlus has retained the design language from its previous generation OnePlus TV Q1 Pro, with the device flaunting clean corners and slim bezels. The Q2 Pro is definitely a TV for minimalists and looks quite premium with its brushed metal aesthetics. Another big thing of note in the design department is that OnePlus has decided to do away with the sliding soundbar setup. Here, instead of a soundbar placed on a moving piece of hardware, we now have a fixed soundbar in place that's just stuck in place below the panel of the Q2 Pro. The sound system's already great performance is also supplemented by Dolby Atmos support and special tuning that has been given to the speakers courtesy of a partnership with Danish sound system giant, Dynaudio.

PERFORMANCE

So in our time testing the TV, we found the Q2 Pro's performance to be quite satisfactory, but only after certain tweaks. As a 4K TV with a big 65-inch panel, the TV's capable of recreating some stunning visuals on screen. With its support for technologies such as Dolby Vision, HDR 10+ and the company's in-house Gamma Engine Ultra, users are treated to visuals that pop, and look very impressive at the first glance. Skin tones are handled well and scenes look expansive and cinematic because of the TV's ability to boost colours and contrast on the fly for moving frames. But for this, we did have to make certain tweaks within the TV's colour management profiles to improve picture performance. Viewing angles are also pretty good. Hooked up to Calman Ultimate, our Spectral C6 Colourimeter registered numbers closer to the 680 nits mark as the typical peak brightness of the panel. While we're sure the TV is reaching closer to the advertised 1200nits mark on a small section of the panel for a short period of time when HDR or Dolby Vision mastered content is run on the TV, the tested typical brightness is sadly nothing to get too excited about, and can prove to be a problem if the TV is put in a bright room. Dark scenes are also a mixed bag if you go looking for trouble on the OnePlus Q2 Pro. For the more

challenging DCI-P3 container, we again tested good numbers, with the DeltaE for colour accuracy only jumping to 3.7 and the Max DeltaE also remaining within acceptable limits for a TV at 9.1. The gamut coverage here was also good at 93 per cent, which was a little short of the advertised 97 per cent mark for gamut coverage. The best RGB balance here was seen at around the 10 per cent luminance mark, with the TV using quite low amounts of reds to create white light after the 10 per cent brightness mark. Away from benchmarks, and cinema performance, we also tested the OnePlus Q2 Pro for gaming performance. This is because gaming is a big push one the TV this time. And understandably so. The TV can effectively handle almost all the game being streamed in, and bring to life, fluid, ultra-responsive visual experiences, that look as nice as they play on screen.

VERDICT

If a big, expansive screen with support for high-end HDR formats such as Dolby Vision and HDR10+ is what you're looking for then this one can definitely be your TV. The Q2 Pro offers good picture quality and sound and elevates it all with impressive features such as VRR and ALLM that promise to improve gaming performance on the TV. If a 55-inch panel suffices your needs, then I'd recommend taking a look at the Xiaomi OLED Vision, or better, even the LG A2. So choose wisely and decide just how much value you're ready to put on the extra gaming features, the sound system and most importantly the bigger panel size on the OnePlus Q2 Pro and then go ahead and make your buying decision.
