Challenges in your tech career?

Irina Ghose, Microsoft

In my early years of education, I had a deep appreciation of being in the world of engineering. I have been at Microsoft for 21+ years and I've done various roles across functions that have built my appreciation of looking at the business from different facets. When it comes to increasing one's own tech intensity, I truly believe that certifications are a great way of gaining, demonstrating, and practicing competence.

Geetha Adinarayan, IBM

It has been a fascinating journey for me spanning 24 years with IBM. The biggest and continuous challenge, which is also an opportunity, is to align the team's passion and energy with the organization's strategy and changes, with the end goal of providing client value. Another challenge we often face is to continuously learn and upskill ourselves. The way I navigated that was to personally join my team in doing the learning exercises.

Jaya Jagadish, AMD

Since it is less common to have women in leadership positions, it is not always easy to be accepted as a leader. But throughout my career, I have come to learn that the onus of success lies with women employees. As I rose the career ladder, earning the trust of the peer group, bringing various teams together, driving several initiatives with focus on India and getting executive attention on the region were some of the biggest challenges.

Rituparna Mandal, MediaTek

My journey in the tech industry began with Texas Instruments, which I joined in 1997, fresh out of college. There have been several challenges during this journey, and I've thrived on crisis management. I remember while developing the MediaTek Helio P60 and GT90 chipsets, we were working round the clock to meet aggressive goals and sometimes it would seem impossible, but we did manage to come out victorious.

Kavitha Prasad, Intel

In the last 25 years, I've held various technology and business-focused roles. I had to overcome my most significant challenge early on in my career. I'm deeply introverted and assumed that my good work would speak for itself. Eventually, my mentor encouraged me to get out of my shell. I learned the delicate balance of being an introvert while pushing myself outside of my comfort zone to confidently contribute ideas. That sense of empowerment has now become my greatest professional asset.
