# How has India's tech industry evolved?

**Priya Murthy, Acer**

The IT industry has had tremendous growth over the years, contributing significantly to our nation's economy. Thanks to the industry's continued emphasis on customer centricity, last year has been a turning point for the tech sector despite the pandemic challenges. With initiatives like Make in India by the Indian government, we are happy to see global companies investing in India and setting up manufacturing units which have also contributed towards employment opportunities.

**Varsha Tagare, Qualcomm**

The tech industry is deeper and more interconnected with other industries than ever before, which offers more opportunities for a diverse talent pool to flourish in existing functional areas and in new sectors like AI, climate tech, and cutting-edge robotics.

**Srikripa Srinivasan, Dell**

Technology is an ever-evolving space and is transforming industries across India. Technologies like telecom, edge-computing and multi-cloud along with everything-as-a-service consumption model will contribute to long term business success and growth. The foundation for all these technologies is the right talent pool, which is already available in India and is continuously growing. At Dell, we significantly invest in training programs to continuously up-skill our team members and enable the workforce for the future.

**Irina Ghose, Microsoft**

It's exciting to see the shift from digitization to digital transformation over the years. Tech related to generative AI, mixed reality and industrial metaverse, security, sustainability, and green computing is fast evolving. It's amazing to see AI solving some of society's biggest challenges. By 2025, 10% of all data will be produced by generative AI models. Analytics is becoming a critical part of organizational workflows. In India, the opportunities for growth in these domains are immense.

**Jaya Jagadish, AMD**

Now is the best time to be a part of the tech industry especially, the semiconductor industry. In my 25+ years, I have seen it evolve from being a chip under the hood to the center of mainstream conversation. Today almost everyone realizes the importance of semiconductors to drive the digitized world. In India, this focus is getting sharper because of the Indian Government's strategic vision to build a self-reliant semiconductor ecosystem in the country.
