In conversation with **Madhav Sheth - CEO realme India, VP, realme and President, realme International Business Group** about realme's 2023 plan and the key areas of focus for technological innovation

Dhriti Datta | dhriti@digit.in

Q What are the new mobile technological innovations realme is gunning for in 2023?

A At realme, we aim to equip young consumers with cutting-edge technology and design and keeping this objective in mind, we are investing in building our product capabilities. We have established four major design studios worldwide to accelerate innovations in smartphone design. Our dedicated R&D center called the realme Global Institute of Leap-forward Technology reflects its strategy and commitment to accel-

erate advancements in future product development, aligning with its mission of driving leap-forward innovations. It will focus on driving innovation across six key areas, including charging, photography, display, gaming, chipset, and industrial design. Additionally, our product strategy follows the “Spire Strategy” approach, in which each product series highlights a ground-breaking technology that serves as the centerpiece of our product range.

Our newly launched realme GT3 will be equipped with 240W charging capabilities, and as the year progresses, we plan to introduce even more incredible features in the future. The 240W

fast charging technology is one of the masterpieces developed by our team at realme Global Institute of Leap-forward Technology and the integration of our R&D resources across the globe will unlock even greater potential for future advancements in technology.

Q Does realme plan on joining the foldable/rollable trend and if so, how do they plan to distinguish themselves?

A As we all know that the smartphone industry is evolving rapidly and the latest technologies such as foldable phones are garnering a lot of consumer interest. We understand the interest in this trend however we believe that it is necessary to take a measured approach when bringing new technology to the market, to make sure consumers enjoy the best experience. As a tech company, we are always exploring new ideas and working round the clock to upgrade our products. However, we don't believe in rushing to release a product unless it is ready to be released and meets our high standards of quality checks and user experience.

We are proud to offer some of the fastest-charging smartphones in the market, which we believe fundamentally improves our users' efficiency. We are also actively working to enhance our camera features, as we believe that the camera is one of the most important features of a smartphone for many users.

While we are cognizant of the interest in foldable phones, we believe that it is important to stay focused on our core strengths and bring products that provide real value to customers. We will continue to monitor the development of this technology and will introduce it to the market when we believe it's ready.

Q How will mobile chipset architecture improve in the coming years?

A At realme, we believe that the next few years will see significant improvements in mobile chipset architecture, driven by technological advancements and
