

Google Pixel 7 Pro

Packed to be pixel perfect

Satvik Pandey | satvik@digit.in

The Google Pixel series is usually the go-to for those who want the stock Android experience on a phone. The latest in their Pro line of phones is the Pixel 7 Pro. Let's take a step-by-step look at the insides of the Google Pixel 7 Pro, and find out just how repairable Google's new phone really is.

Where things show

To open the screen, you will need a suction handle, opening picks, tweezers, and a spudger. The first thing you need to do is heat up the screen to soften the glue holding everything in place. Once that is done, put the suction cup on the screen, pulling away slowly. Then, carefully insert the picks, avoiding the gap between

the screen housing and the display panel. After the picks have been inserted, you can slice the rest of the glue and open the screen like a book. Do not to lift it off directly, as there's a ribbon cable connecting the screen to the motherboard. To remove the bracket holding the display ribbon cable in place, just gently pry away the bracket holding that in place. Once that is out of the way, all you need to do is pry away the ribbon cable from its connector using the spudger. This will separate your phone's screen from the motherboard.

The powerhouse

After the screen, one of the most replaced parts of a phone is the battery. Which can be pretty tedious on the Pixel 7 Pro. Once you have removed the screen, peel off the graphite foil covering the battery and the midframe of the device. Next, remove the two Torx T3 screws holding the charging port bracket in place. Then comes the midframe, which can be removed by unscrewing the six Torx T3 screws holding it in place. After the midframe has been removed, just unplug the Lego-style battery connector using the spudger. Make sure to remove the thermal paste from the motherboard. Heat the adhesive holding the battery in place, and then, by pulling on the two ends of the battery pull-tabs, and swaying them from side to side, remove the glue holding the battery in place. Phew.
