

EPOS ADAPT ANC 160T USB-C

A single edged sword

The buttons are clicky and responsive, and the dedicated ANC and mute buttons came in handy in day to day use.

Features

As for the features of these headphones, there's not much to talk about, as is the case with any headphones from this class.

Regardless, the UC certification on these headsets did make them a great pair to drive our daily calls.

The microphone is also complimented by the EPOS Voice technology and the in-built noise cancellation on the mic worked well too!

Keep in mind that there are different connectivity options. The one that we received was the USB-C variant. This means that the connectivity was limited to devices with USB-C. If you are looking for a more universal experience, then we'd recommend you go for the one with AUX connection, as the last variant, which is available is the one with USB-A, which would again limit connectivity.

Performance

When trying to weigh in the performance of these headphones, we primarily focussed on the quality of vocals reproduced by the drivers that ADAPT 160T ANC USB-C headphones come with. In our time with the device, we did have a hard time finding flaws.

There were some conditions, especially while gaming when we wished that these headphones had slightly

enhanced mids. However, overall, during calls, when the only sound being reproduced by the drivers was of the person on the other end of the call, these headphones held their own.

Given that the sound signature of these headphones is focussed on vocals, they make for a decent pair of headphones for content consumption like watching videos or movies and even listening to podcasts. When listening to music and songs, these headphones also performed well, but are of no match to the ones that are purpose built for listening to music. Given the positioning of these headphones, we did not expect them to do well either way.

Now, let's talk about the microphone performance. As we had prefaced earlier, these headphones have a mic that holds its ground in most conditions. If you are in a quiet room or in a larger conference hall setting with people chatting in the background, the chances of your voice, when on calls being affected is very less.

If you don't mind the design and decide to take these headphones out on roads, where the background noise is much higher, you might get some complaints about background noise. But, then again, that is a condition where most headphones fail to achieve perfection.

The bottom line

The bottom line when it comes to the Sennheiser | EPOS ADAPT 160T ANC USB-C headset is that if you are looking for a pair of headset that will serve you well in a WFH or office setting where

you are taking calls almost through the day, then these should be on your list of contenders. For any other use, you should look elsewhere. If you are gaming or listening to music along with primarily taking calls and attending meetings, then you should be fine with these headphones.

—Satvik Pandey

The EPOS ADAPT ANC 160T USB-C is the latest entry by EPOS as a part of its collaboration with Sennheiser for producing work from home headphones. The brands have been working together for sometime now, making headphones for both in-office and gaming use. So, when the headphones showed up at the Digit Test Centre, we spent some time with the headset, trying out its calling, and much advertised ANC capabilities.

Build and Design

The ADAPT 160 ANC USB-C headset borrows a lot of its design elements from the Sennheiser HD 2.30G headphones. The only addition in terms of the design is the retractable boom microphone and the in-line control. The Sennheiser | EPOS branding on the headband is also something that makes these headphones visually stand out.

The materials used in these headphones also feel pretty robust. There's enough room for adjustments no matter the size of your head. The firm yet comfortable clamping force and soft cushions on the ear cups made these headphones comfortable to wear during long calls and gaming sessions.

The cable is unbraided, which might irk some people. As for the in-line control, the housing has a two tone finish. The trim has a glossy finish, with the rest of the body having a black matte finish.
