

Motorola Moto G73

Solid performer with some misses

Moto G73 is the successor to the popular Moto G62 – a 5G phone that launched last year. However, it does lose out on some features present in the more recent G72. Does the promise of 5G compromise for these lost features? And how does the Moto G73 fare against competition? Let's delve into it.

BUILD AND DESIGN

The Moto G73 weighs in both lighter and thinner than the Moto G62, its predecessor. It has a premium-looking, slick rear panel that attempts to emulate the ones on its more premium offerings. The camera module doesn't jut out too much. There's also a capacitive fingerprint sensor embedded in the power button which works decently well for the most part. The phone is also IP52 dust and splash resistant – it seems like Moto has been stuck at IP52 for far too long.

DISPLAY

Moving on to the display, you get a regular (and dated) IPS LCD display – which is a hard pill to swallow at almost ₹20K. The chin bezel is quite chunky as well which dilutes the premium look up front. Visuals look decent but they aren't as vivid as on OLED or AMOLED panels in this price range. The phone comes with variable refresh rate. However, when we checked the refresh rate at Auto, the phone never exceeded 90 Hz, and only when you manually turn on 120 Hz, do you actually get 120 Hz when scrolling. With Adaptive Brightness turned on, we recorded 203 nits of peak brightness outdoors. The display is not HDR-certified as well. It has mediocre viewing angles and decent colour.

PERFORMANCE

The Moto G73 performed all basic tasks without hitch. In synthetic benchmarks, the Moto G73 performed admirably well. We compared it against the Realme 10

Pro and the Redmi Note 12. In all our benchmarks, it came up with stellar numbers. We also ran the CPU Throttling Test

where the phone merely throttled to 92 per cent of its peak performance in 15 minutes. In GPU tests, it got impressive scores in GFXBench but couldn't run 3D Mark since the "device does not support all the Vulkan features required to run this test". We ran Call of Duty: Mobile on high graphics and the stutters were almost non-existent.

CAMERA

In well-lit conditions, you get decent shots from the primary camera with good dynamic range and detail. However, the landscape shots – with HDR turned on look slightly oversharpened. The colours are quite natural, which is good. Indoor shots in well-lit conditions look good too. The natural bokeh effect is quite decent but there's some fringing around the edges of objects. Portrait images from the main camera are not impressive though. The edge detection is also quite poor. Without portrait mode turned on, photos are quite detailed. Ultrawide images taken in

daylight have decent dynamic range and colours but there's quite a bit of barrelling in the corners. You get macro mode on this phone as well and the shots are strictly mediocre due to the lack of stabilisation. In low light, we used Night Mode shots were often blurry and lacked detail in the shadows which is evident, especially if you pixel peep. Lastly, the 16 MP selfie shooter clicks really good shots in daylight with heaps of detail and natural colours. Portrait mode selfies are decent but the edge detection isn't the greatest. As for videos, they look decent in daylight but aren't as promising in low light.

BATTERY

The Motorola Moto G73 houses a massive 5,000 mAh cell that provides great battery life. The phone can easily power through a day of medium to heavy usage and still have some juice to spare by night time. We ran benchmarks, played games, clicked photos, and more and we still had around 24 percent battery remaining at the end of the day. So, if you're a light user, expect two days of power without having to reach for the charging cable. In our 4K video loop test, it lasted a whopping 17.5 hours.

VERDICT

With the new Motorola Moto G73, the company has attempted to provide users with a compelling 5G option with a couple of improvements sprinkled in over the Moto G62. However, there are definitely a few misses – be it the lacklustre IPS LCD display with low peak brightness and sunlight legibility issues or the mediocre low-light photos the phone clicks, these misses can be enough to deter users from picking this phone over competitors.

–Dhriti Datta

SPECIFICATIONS

Processor: MediaTek Dimensity 930 | RAM: 8 GB | Internal storage: 128 GB, expandable up to 1 TB | OS: Android 13, MyUX | Battery capacity: 5,000 mAh | Charging: 30 W | Display: 6.5-inch FHD+ IPS LCD | Weight: 181 g | Cameras (rear): 50 MP + 8 MP | Camera (selfie): 16 MP | Video: 1080p @ 30 fps | 5G Support: Yes
