Arm semiconductor chips are reportedly in the making

Arm won't just design, but also manufacture chips as per a new FT report. The British company which is known for selling design IPs to brands like Apple, Qualcomm, Nvidia, etc. is aiming for vertical expansion into the chip-making business. Here's what we know so far about this.

As already mentioned, Arm's semiconductor plans include not just designing, but also manufacturing

chips, states the report. However, since it's new to the game, it will seek help from manufacturing partners. The report reveals Arm has created a "solutions engineering" team that's

tasked with the development of prototype chips. These chipsets will be used in mobile phones, laptops, and other electronic devices. The company has reportedly made some strides so far. It has been working on an advanced chip for the last 6 months. This is said to be a step above the current chips. Once its IPO happens sometime this year, Arm could announce its efforts to the public. <https://dgit.in/ARMinMaking>
