Indian smartphone market sees historic dip, with 20 per cent fewer shipments

The research firm Canalys has published a report that claims a decline in the Indian smartphone market for the first quarter of 2023. The 600 million users' market had a historic dip in the first three months where the shipments in India dwindled by 20% year-on-year which is the first-ever Q1 decline. The decline is suggested to have been caused due to weak consumer demand, high inflation, inventory correction and component shortage.

Amongst the top five players in the Indian market, four have seen a dip. However, Oppo has seen a growth of 18% with 5.5 million shipments resulting in the company overtaking Xiaomi and Vivo. Samsung, on the other hand, overtook Xiaomi in the Q4 2022, and regained its top spot in Q1 2023 with 6.3 million units in shipments and a whopping 22% market share. Whereas, Apple claimed the second position with a 21% share. Xiaomi with 5 million shipments and Vivo with 5.4 million shipments stand fourth and third in the list respectively.

Canalys affirms that the vendors are optimising "retail, local sourcing, manufacturing, and research and development" and are persistent to stay bullish to fuel the market for long-term avenues even though the Indian market is experiencing an early-year struggle. The Canalys report states that Samsung with its latest 5G-powered A-series, Galaxy A and Galaxy S smartphones has created an impact on the offline market. On the other hand, a

new offline battle is to emerge as Apple steps in with its new retail stores which are aimed to "further enhance its brand experience and position." in the country. These two tech giants have enabled India's smartphone export growth. In the Q1 2023 India has seen a record-breaking export value of almost \$4 billion.

Global Smartphone Market

India is not the only smartphone to be hit by this insurgence, globally there has been threatening trends with a market decline stall with dropping by 12% compared to the last year. Low consumer confidence, excess inventory, rising prices, and supply chain inadequacies have impacted the industry. This is the fifth quarter in a row where the market has seen a slump.

Meet AutoGPT, the ChatGPT version everyone's talking about

Al is taking over the world by a storm with the introduction of ChatGPT and other generative AI tools. However, while everyone was still getting accustomed to the idea of conversational AI, OpenAI, the parent link of ChatGPT, has taken the baton forward with AutoGPT.

Toran Bruce Richards' creation, AutoGPT, in the simplest of the terms, is an experimental open source Python

application that enhances the GPT-4's capabilities. The application helps in performing tasks and automating them in the intended sequence. Auto-GPT uses long-term and short-term memory management with GPT-4 operations for text generation and incorporates file storage and summarization with GPT-3.5. Where you can ask ChatGPT to fulfill

preliminary tasks such as writing an email and debugging a codeset, AutoGPT along with these advances the task capacity with minimal human intervention. The tasks can range from goal prompts such as growing a Twitter Account, to developing and managing multiple businesses.
