

the 8GB + 256 GB variant – which I got for review. So, how much better performance do you get for that price difference?

Let's start with benchmark results. The POCO X5 Pro soundly beat the Moto G73 in AnTuTu scoring over 100K more, but in Geekbench Single Core, it was actually left behind by the cheaper Moto G73 as you can see. In the Multi-Core test, the POCO X5 Pro again took a substantial lead. I also ran PCMarkWork, which simulates real-world tasks, on both phones and the POCO X5 Pro only had a slight lead here. Lastly, to test the CPU, I ran the CPU Throttling Test, where both phones performed admirably, meaning they won't heat up and throttle too much even while running intensive tasks.

Moving on to GPU tests, the Moto G73 refused to run 3D Mark. The POCO X5 Pro, on the other hand, got a decent score of 2459 in 3D Mark WildLife. In GFXBench, the POCO X5 Pro performed considerably better than the Moto G73 in all three tests. This translates to real-world gaming as well, since when I fired up COD: Mobile, POCO runs it at Very High graphics by default while the Moto runs it only at Medium by default. With the default settings active, the phones got similar scores in GameBench – both of which are very impressive. I switched on High Graphics on the Moto G73 and played a multiplayer match and got an even better score of 60 fps at 97% stability, but the device did get warmer than it was at Medium graphics.

So, you could face throttling in long gaming sessions on the Moto G73 at High Graphics. Nevertheless, both are capable devices – each with its own Gaming Mode that activates in-game. However, the X5 Pro is definitely more geared towards gaming than the Moto G73. The POCO X5 Pro also does better at keeping multiple intensive apps running in the background simultaneously. General multitasking and real-world usage are great on both phones, they breeze through most apps without hitches and scrolling feels smooth due to the 120 Hz display. Lastly, the UI is vastly better on the Moto G73 – lesser bloatware and a clean experience. Also, the Moto G73 runs Android 13 out of the box, while the POCO X5 Pro runs only Android 12.
