

Poco X5 Pro (Left) vs Moto G73 (right)

Poco X5 Pro (Left) vs Moto G73 (right)

## Camera

Both the Moto G73 and the POCO X5 Pro come with new and improved primary cameras compared to the ones on their predecessors. The Moto G73 has a 2µm 50 MP primary sensor and the POCO X5 Pro features a 108 MP ISOLCELL HM2 primary lens. Starting off with daylight shots, the Moto G73 has more natural colours while the POCO X5 Pro's images are more saturated with oodles of contrast. Detail retention in such conditions is better on the Moto G73 with more detail captured in the shadows. Although the Poco X5 Pro's images look more social-media-worthy, the Moto G73 definitely captures more detail. Both phones have 8 MP ultrawide cam-

eras, and Moto does better at capturing details in shadows while the Poco X5 pro controls highlights better – both these ultrawide cameras could definitely be better. But overall, Moto's ultrawide images look slightly more detailed with better dynamic range. Moto also has a macro mode which utilises its ultrawide lens for macro pictures. The macro images are nothing spectacular and usually blurry since there's no stabilisation.

Indoor images in well-lit conditions are usually softer on the POCO X5 Pro. Natural background blur is more aggressive on Poco, so a lot of the subject can be out of focus when taking close-ups. Also, note that we've faced some lens flare issues on

the Poco X5 Pro as well. As for portraits, both phones have mediocre edge detection but Moto's skin tone reproduction is definitely more natural. The background blur is more understated on the Moto. In tricky lighting though, Moto really overexposes the image which looks unnatural. For selfies, Moto provides a more detailed image by a slight margin but Poco's selfies have quite a bit of detail in ideal lighting as well. Portrait selfies look more natural on the Moto G73. As for low-light images, both phones show some weaknesses. Moto is better at clicking shots with human subjects at night but generally, the Poco X5 pro has more detail in its low-light images. Overall, both cameras, especially in daylight, are good for the price range – but the Poco X5 Pro's camera shows more versatility in low light shots.

## Verdict

If the Moto G73 and the Poco X5 Pro carried the same price tag, we would definitely be more inclined to recommend the Poco X5 Pro. It has definitively better gaming performance and its primary camera performs better in low light. However, due to the ₹4-6K price difference, the Moto G73 is great value for money. For ₹6K cheaper, you get competitive performance in the real-world and benchmarks, a solid primary camera in ideal lighting conditions, and a cleaner user interface. Additionally, you get an extra macro mode and Android 13 out of the box.

So, based solely on value – the Moto G73 is the more compelling option. However, based on purely performance numbers – the Poco X5 Pro is still superior. So, ultimately, it depends on your use case. If you're a hardcore gamer, we would recommend the Poco X5 Pro but if you're looking for a budget device with well-rounded abilities, the Moto G73 provides better value for money. **Ed**
