

ResMed OneSleepTest

I wore the ResMed OneSleepTest for 3 nights and here is my experience

GS Vasan | vasan@digit.in

Although I have been gifted with sound sleep all my life, there are people in my family and friends who have poor sleep and who suffer from associated health effects like tiredness, stress, drowsiness, impaired memory, etc. So, when I came across the ResMed OneSleepTest, I was curious enough to test it out. I wanted to see how helpful these sleep health analyzers are to monitor one's sleep health and possibly meet sleep goals. As a wearable tester, I often wear smart-watches during the night to track my sleep, but this is a specialized device, and unlike anything I have used before. So, let's see how my experience was wearing it for 3 nights. To broaden the scope of my test, I also had my mom wear it for 3 consecutive nights.

Once my testing was done and I received the analysis from Resmed, I also contacted sleep specialists at the

company with some queries and I have included those in this piece.

Let's begin with the test first.

How I used ResMed OneSleepTest to track my sleep health?

The ResMed OneSleepTest kit comes in a small package as the wearable itself is tiny and its application is also rather easy to use. The actual device is white-coloured and pill-shaped. There is a red LED indicator on one side. You have to

strap it to your index finger using the bundled adhesive strips. Ensure the LED side faces your finger while you fasten it.

You get how to do this with proper visual illustration in the ResMed NightOwl app. You can download the app from Google Play (on Android) and App Store (on iOS). The app is fairly simple to use but needs registration with your email ID and some basic details.

Further, you just have to connect the device to the app, activate it using the button on it, and wear it while you sleep. There will be a timer in the app that you have to turn off when you wake up the following morning. You will have to fill out a survey on the app and only then your one night's test is considered complete. Also, you can unfasten and remove the device at this point. The strip can be disposed of and don't worry, there are plenty of spare strips to do the 3-night OST test.

If you perform all these steps properly, after 3 nights, a ResMed sleep specialist assigned to you will analyze your sleep health data and send you a report over email.

The sleep specialist who was assigned to me was quite amiable and responsive. They will help you understand your sleep results and the OST report.

I didn't have any sleep problems and the report reflected the same. However, my mom who occasionally has poor sleep took this test and her report also came rather fine. So, I am happy that both of us don't have sleep apnea or any other problems.

ResMed OneSleepTest: What do I think of it?

As I have already mentioned, OneSleepTest is a simple and comfortable device to wear. It is very easy to use and offers an easy-to-understand analysis. But, it's hard to say how accurate some of those results are. I lack the proper mechanism or apparatus to benchmark it. All I have is some readings (like SpO2, sleep time, and heart
