

Grafiati

End-of-course research papers and dissertations are some of the most gruesome assignments to complete. Back in the day, RefMe used to be one of the best citation management apps. But, after Chegg acquired it in March 2017, we were left looking for alternatives, and that was when Grafiati came in. For those who don't know, and kids in school, do take note you will have to do it at some point as well – Grafiati is an online tool using which you can generate citations in a variety of formats, including APA, Harvard, MLA, Chicago, etc. While the claims made by the creators of Grafiati cannot be verified, in my experience, the service is solid and can be a good starting point for most stu-

dents working on their academic writeups. They offer three tiers, which you can look into on their website and choose as per what you need.

Trello

Either in school or college, the plethora of things that are happening around us, make it difficult to keep our daily schedules together at times. That is where Trello comes in. Trello is a basic yet very useful tool that helps you manage projects and daily tasks in a single place. You can brainstorm with your team while working on projects, share images and mockups,

and maintain deadlines and POAs, all in one place with Trello. While the basic tier is free and comes with a fair selection of features, if you are looking for additional features, such as unlimited storage on the platform, you can go for their paid plans as well. And are tailored depending on what features you want.

Wolfram Alpha

If you are someone like us who goes into rabbit holes only to land up reading about capybaras and their rise in the meme culture when you wanted to research about coal, then you should consider looking at Wolfram Alpha. It

is a search engine dedicated to academic research. You can choose between giving in a natural language input or a math input, and if that is too much, it has been integrated into ChatGPT Plus. When you will use it, you will realise how much ahead of time it was. It was like ChatGPT before anyone had thought of it.

Pocket

Another classic app that we could not leave off this list. Pocket makes for a very handy tool for students who want to save web pages for comfortable reading on the go. It also offers cross-platform synchronisation. Not only that, if you save an article on Pocket, you can change basic settings like font sizes, styles, and viewing modes to suit your needs. Pocket offers a handful selection of organisation tools so that you do not lose track of whatever articles you save. The base tier offers almost all the functionality that you will need as a student, so you shouldn't have to worry about it all that much. <https://getpocket.com/en/>
