

monthly subscriptions that are out there, trying to dig deep into your pockets. And trust me when I say this, there's nothing but paywalls that'll come to your rescue.

Sometimes, when you are bursting out of the cocoon that is subscription based/paid apps, it can be difficult and intimidating to start working with open-source software. But once you are in, there's no going back. You'll be hooked, my friend. In this article, I bring you, the ultimate gift of computational excellence and a prime example of empathy of the people on the internet who are burning their eyes away typing out code – open source software – that'll help you save some money and get things done at the same time.

Kiwix

If you're someone who wants to reserve their mobile data for doom-scrolling Reddit or watching the latest Marvel films at the end of the day, the Kiwix will be a lifesaver for you. With Kiwix, you can build your own repository of articles and all sorts of information from the internet that will be there at your fingertips, even when you're offline. The software has a repository of existing articles that you can go through, and if you do not find what you are looking for, then you can load in your own content in. The setup is easy, and the UI is clean without any ads popping in. And, the best part is, that it can run on any device!

arXiv

Doing proper research for your homework or any project that you are working on, can be an actual chore.

We do it every month for our articles and trust me, no one will understand better than we do. While as an organisation, we can pay for subscriptions to various research paper aggregators, getting access to papers as a student can be quite difficult. To combat this issue, Cornell University's kind folk created arXiv. It is a free distribution service and an open-access archive of research articles. And, if you are wondering why did they do that, then I'll drop their own words that explain their efforts in the best way possible – "If research isn't accessible, can we truly call it "open" science?"

Calligra

If you are a student, then at the end of every semester, you must be required to create a ton of presentations to accompany your projects and submissions.

While PowerPoint and Canva

are some of the tools that make for handy tools to have, why not step things up a bit? Calligra is a powerful graphic art and office suit that equips you with all the tools that you will need to create impactful presentations and supporting documents that will put all the other mundane submissions to shame.

Now, if you are looking for more apps, we have curated a list for you in this month's eDVD. Do make sure to check that out! And, if you haven't already, join the SKOAR! Discord server and reach out to fellow geeks and gamers to talk everything about tech, gaming, and studies. Who knows what you find?
