

LAPTOP vs TABLETS (REVISITED)

Is this still a debate?

Manish Rajesh | manish@digit.in

When the thought first crosses your mind, it's not really a contest. Laptops win hands down when it comes to Tablets vs Laptops. Then you start to wonder, do they really? We actually featured this very same debate back in 2016 as well, which one is better for students? Well, things have changed. Read on to find what's new:

Performance

When it comes to basic operations, such as checking emails, surfing the web, streaming video or audio, both devices are pretty much on par. However, laptops tend to be better at multi-tasking since they generally tend to have more powerful hardware. Certain tablets, like Apple's iPad for instance, can still match up to some laptops in this aspect. For more specialised use cases, such as video production, and photo editing, you might want to stick to a laptop unless you know you're going for a tablet like the iPad Pro that you know can handle these tasks. Laptops and tablets for these specialised use-cases always tend to come at a premium.

Display

Laptops have bigger displays. That is a given. But sometimes they are not the highest resolution panels. However, tablets, especially the pricier ones, have much higher resolutions despite the smaller screen real-estate. There's also the fact that the larger your laptop display, the bigger the hit on your overall portability (including

weight). Not an issue tablets suffer from. So if portability is a very important factor to you, keep this in mind.

UX and UI

This is a more subjective aspect. We can say that in general tablets tend to have a more user-friendly experience overall. This is because the target demographic is casual users. Laptops meanwhile tend to focus more on functionality. You have access to a lot more advanced options with more ease. This applies to many apps that are available on both devices, with desktop versions of the same applications having a lot more features and options than the tablet versions.

Peripherals and add-ons

With laptops, you have a trackpad and a keyboard. If need be you could always plug in a mouse, a monitor, speakers or headphones. Easy access to USB ports, external storage etc. You get the idea. Both laptops and tablets have Bluetooth support. Tablets on the other hand have virtual keyboards, or touchboards. These aren't as fast or efficient as physical keyboards. Of course, you always have the option of using a Bluetooth keyboard, but that is an additional purchase.

Software

The experience of the same software can be very different depending on what gadget you're using it on. 9/10 times, on a tablet it will be more sluggish than that of the laptop. The exception here are of course premium
