

Fascinating insights from the State of India Gaming Report

Lumikai has released the latest State of India Gaming Report in partnership with Amazon Web Services (AWS) that brings to light several interesting pieces of information like the growth of the e-sports market, including paying users, women players, and demand for India-themed games. It has surveyed 2,240 smartphone users from various places and demographics.

Here are 3 fascinating findings from the report:

1. Growing participation and payments in the gaming industry

According to the report, the number of gamers in India grew fourfold year on year from 150,000 in 2021 to 600,000 in 2022. It could jump another 2.5 times in the coming 5 years to hit 1.5 million users by 2027.

The whole industry reportedly raked in \$40 million last year and is said to touch \$140 million by 2027 at a CAGR of 32 per cent.

Well, the players are not only participating, but they are also paying up

as around 64 per cent of paying gamers spend on in-app purchases, and about 57 per cent of them are on subscription payments.

Overall, a large percentage of players up to 59 per cent have apparently started spending on games in the last year. More of these players (around 50 per cent) are interested in casual games, closely followed by a demand for mic-core titles at 48 per cent and, finally, hyper-casual and RMG games at 39 per cent. The potential to earn is the key impetus for 45 per cent of

paying players. Willingness to pay and better content as well as in-game goodies, also excite players to pay up.

2. Change in gaming preferences

As already discussed, more people are playing casual games like Candy Crush and Ludo King. Not only that, a significant number of players at about 35 per cent have revealed that they have increased their play hours in the last 12 months.

An exciting thing we learned is the growing love for Indian-themed video games. This includes 82 per cent of gamers interested in Indian mythology, 79 per cent looking for games with Indian themes and history, and 78 per cent prefer games based on Indian celebrities.

3. Behavioural trends in the gaming space

Some notable behavioural patterns include 98 per cent of Indian gamers on smartphones, 23% playing on PCs/laptops and 14 per cent on gaming consoles. Most of these players (at about 56%) reside in non-metros. The players are spending 8.5-11 hours per week and interestingly, women tend to spend more hours playing than men. The average time spent per week was highest in games like BGMI and Clash of Clans, while more hardcore games like DOTA 2 and Genshin Impact were close second. *
