

EMotorad Lil E

Packs a punch

It is not that often that motorised scooters show up at the Digit Test Centre. So, when the EMotorad Lil E showed up, everyone wanted to give it a try. And, give it a try, we did. It wasn't long before we had everyone in the office compound waiting in line to take this peppy scooter for a spin. Packed with a 250W Front Hub Motor, this scooter had enough speed and power to ferry our in-house techies around the lot.

For the ones who wanted to take it slow, we had the speed settings set to the lowest 15 kmph, and for the ones who wanted to explore the 'thrill' of going around a parking lot at 25 kmph, we amped up the speed settings to extract maximum power. The rear discs did their job well, even when some of our experienced riders were on the scooter, pushing the scooter to its limits. Don't worry, all of us had protective gear on. The coating on the base plate of the scooter also made sure that our feet stayed planted when we sped things up or brought them to a grinding halt. One gripe from some of our more experienced personnel was that the braking wasn't as consistent or intuitive as they'd like it to be and took a fair bit of time to get accustomed to its quirks. As for the range, we did not test it extensively but from the few times we drained the battery down to zero and from our cruder estimates of the distance we covered on it, we are pretty happy with the advertised 20 km range.

Overall, the Lil E is by no means a commuting vehicle and we would not take it out on our famously atrocious public roads (though admittedly, we did try). The Lil E is a toy. An awesome and fun one for sure but a toy nonetheless. We highly recommend it if you are someone who lives in a gated community with smooth roads and a long walk to the shops.

Logitech MX Keys S – Totally worth the experience...

Logitech launched its latest office keyboard, the MX Keys and I was fortunate enough to have gotten a chance to use the product before it hit the market. Here's my account of using the Logitech MX Keys S, which has launched at the price of ₹13,295.

The Logitech MX Keys S sports a design that would blend into any modern office space. The keyboard has a pretty slim profile. Despite that, there's very minimal flex when you pick the keyboard up and twist it around.

As for the keys, they have a matte finish and sport small circular recessions. Personally, I liked it, however, for many, it might not be a welcome addition. MX Keys is a full-sized keyboard, so you need to make sure that you have enough room on your desk to be left with this on it. MX Keys S comes equipped with Bluetooth Low Energy. This is a very welcome addition as it helps conserve battery life. Just like other MX devices that Logitech sells, the MX Keys S, can be connected with up to three devices at the same time. When I tried it, just to make sure that it works as well as it does on my old and trusty MX Master 2S, I wasn't surprised to find it in perfect

working order. As for the battery, Logitech claims that the keyboard after a full charge, can last up to 10 days. While I had the keyboard for 10 days (almost), given that there was a weekend in between, I never got around to clocking in the full monty. However, at the end of a week of use, it had just over 5 per cent battery left, which, if stretched, could get me to the 10-day mark. The keyboard apparently also has fast charging capabilities. However, no claims have been made by Logitech as to how fast the charging is. Coming from mechanical keyboards, the typing experience on the MX Keys S was surprisingly not bad at all. Of course, you will not get the satisfaction that many crave when using mechanical keyboards. However, the small tactile bump the short distance that the keys travel was enough to sell the experience to me.

If you are someone who uses a hybrid laptop/desktop setup and gets annoyed by the change in experience every time, then this keyboard would be perfect for you.
