Three new Macs may launch at WWDC 2023

With Apple's marquee event for the first half of the year, the World Wide Developers Conference (WWDC 2023), coming close, news about product launches and announcements have started picking up steam. The latest news to hit the floors is that Apple is set to start accepting trade-ins for their M2 MacBooks from June 5. This comes on the back of rumours and several reports suggesting that Apple is set to launch new MacBook laptops at the event.

WWDC 2023 is just days away, and the news that Apple will start accepting trade-ins of the Mac Studio, 13-inch M2 MacBook Air and 13-inch M2 MacBook Pro, as reported by Mark Gurman via a Tweet on his handle, makes the belief that the brand will launch a new laptop, nothing but stronger.

The trade-in program starts on the same day as the event, where Tim Cook and co could take to the stage to announce their latest laptops. Right now, there is no confirmation about the specifications of these rumoured laptops. However, given the way

that Apple has operated in the past, we can safely assume that the laptops or other Mac devices that Apple launches could be powered by their new M3 processors.

Apple had recently opened its first two stores in India, so fans of the brand looking to get their hands on the latest and greatest hardware from the brand can walk into these stores and look for themselves if they want to get these devices or not.

OnePlus 12 leaks hint at major camera improvements

OnePlus 12 specifications have appeared months before the device's anticipated release, as the brand prepares to flaunt its new flagship model.

If the reported specifications are accurate, the phone will include significant improvements over the OnePlus 11 5G in terms of its camera and processor. The OnePlus 12's specifications have been revealed by tipster Yogesh Brar based on the setup of an engineering unit.

According to the leak, the OnePlus 12 will have a 6.7-inch OLED display. The display has a quad-HD resolution and a 120Hz refresh rate. Additionally, according to Brar, the Qualcomm

Snapdragon 8 Gen 3 SoC, model number SM8650, will be found within the OnePlus 12 5G. On the back panel, there will be a triple camera system: A 50-megapixel main camera, a 50-megapixel ultra-wide camera, and a 64-megapixel periscope sensor.

Brar did not provide any further information regarding the specifics of these sensors, but if the leaked speci-

fications are genuine, the OnePlus 12 will receive some significant improvements in its camera department.

According to Brar, the OnePlus 12 5G will include a 5,000mAh battery with 100W fast charging support, just like its predecessor. The OnePlus 12 launch event, according to the tip, will take place in December. The smartphone will probably make its debut in China before possibly going on sale in additional markets in the coming months. The arrangement of the engineering unit serves as the basis for the OnePlus 12's rumoured specifications. It's likely that the device's specifications will alter before the firm launches it six months from now.
