Google Bard finally accessible in India

At Google I/O 2023 conference, AI was the talk of the town, as Google just revealed that its beloved AI chatbot, competition to ChatGPT, Google Bard will be accessible in India and other countries.

Months after it was first made available to users in the US and the UK, the waiting is now being eliminated in 180 nations and territories. Access to Bard, Google's AI chatbot and a rendition of ChatGPT, has now been extended widely around the globe. To start using Google Bard, just visit <https://bard.google.com/> and click on the "Try Bard" button. Google Workspace accounts may need access authorisation from their administrators.

In addition to being made available in English, Google Bard will also support the languages of Japanese and Korean, according to a Google announcement. Bard will utilise the company's new substantial language model PaLM-2. Google will also expand the availability of the top 40 languages going ahead; the corporation is launching various

languages gradually as a precaution, it was stated. Google also says that Bard will be more visual with both, its user prompts and responses. It will be able to offer responses that extend beyond plain text and come with rich graphics, which for the time being only contains images, thanks to the integration of multimodal context.

Google Duet AI is here!

With its redesigned Google Workspace suite, Google is bringing its AI-powered productivity solutions for mobile users to the next level. The brand is getting ready to launch a number of new AI technologies that will improve user productivity and streamline processes thanks to the potent PaLM 2 family of models. The features that make up Duet AI for Google Workspace are packed together to aid users in organising and creating new work processes.

Duet AI will enhance your emails on Gmail mobile by providing contextual support so you can write professional replies with names and other pertinent information filled in automatically. Google also claims to be developing tools that would enable you to create

whole emails by answering a few straightforward questions.

You may create original backgrounds for your video conversations using Duet AI on Meet, which will enable "users to express themselves and deepen connections during video

calls while protecting the privacy of their surroundings."

Duet AI will streamline the categorisation of information and the formulation of personalised plans on Sheets. Instead of spending time manually entering data, new categorisation tools will recognise the context of the data in a cell and apply a tag to it, saving

you time. Additionally, sheets will have capabilities that will allow you to make unique plans for jobs and projects by using short phrases as suggestions. State your goals, and Sheets will create a strategy for you in line with them.
